SystemTap Tapset Reference Manual

by SystemTap

Table of Contents

Chapter 1. Introduction

SystemTap provides free software (GPL) infrastructure to simplify the gathering of information about the running Linux system. This assists diagnosis of a performance or functional problem. SystemTap eliminates the need for the developer to go through the tedious and disruptive instrument, recompile, install, and reboot sequence that may be otherwise required to collect data.

SystemTap provides a simple command line interface and scripting language for writing instrumentation for a live running kernel. The instrumentation makes extensive use of the probe points and functions provided in the *tapset* library. This document describes the various probe points and functions.

Tapset Name Format

In this guide, tapset definitions appear in the following format:

```
name:return (parameters)
definition
```

The *return* field specifies what data type the tapset extracts and returns from the kernel during a probe (and thus, returns). Tapsets use 2 data types for *return*: `long` (tapset extracts and returns an integer) and `string` (tapset extracts and returns a string).

In some cases, tapsets do not have a *return* value. This simply means that the tapset does not extract anything from the kernel. This is common among asynchronous events such as timers, exit functions, and print functions.

Chapter 2. Context Functions

The context functions provide additional information about where an event occurred. These functions can provide information such as a backtrace to where the event occurred and the current register values for the processor.

Name

function::print_regs — Print a register dump

Synopsis

```
print_regs()
```

Arguments

None

Description

This function prints a register dump.

Name

function::execname — Returns the execname of a target process (or group of processes)

Synopsis

```
execname:string()
```

Arguments

None

Description

Returns the execname of a target process (or group of processes).

Name

function::pid — Returns the ID of a target process

Synopsis

```
pid:long()
```

Arguments

None

Description

This function returns the ID of a targer process.

Name

function::tid — Returns the thread ID of a target process

Synopsis

```
tid:long()
```

Arguments

None

Description

This function returns the thread ID of the target process.

Name

function::ppid — Returns the process ID of a target process's parent process

Synopsis

```
ppid:long()
```

Arguments

None

Description

This function return the process ID of the target proccess's parent process.

Name

function::pgrp — Returns the process group ID of the current process

Synopsis

```
pgrp:long()
```

Arguments

None

Description

This function returns the process group ID of the current process.

Name

function::sid — Returns the session ID of the current process

Synopsis

```
sid:long()
```

Arguments

None

Description

The session ID of a process is the process group ID of the session leader. Session ID is stored in the signal_struct since Kernel 2.6.0.

Name

function::pexecname — Returns the execname of a target process's parent process

Synopsis

```
pexecname:string()
```

Arguments

None

Description

This function returns the execname of a target process's parent procces.

Name

function::gid — Returns the group ID of a target process

Synopsis

```
gid:long()
```

Arguments

None

Description

This function returns the group ID of a target process.

Name

function::egid — Returns the effective gid of a target process

Synopsis

```
egid:long()
```

Arguments

None

Description

This function returns the effective gid of a target process

Name

function::uid — Returns the user ID of a target process

Synopsis

```
uid:long()
```

Arguments

None

Description

This function returns the user ID of the target process.

Name

function::euid — Return the effective uid of a target process

Synopsis

```
euid:long()
```

Arguments

None

Description

Returns the effective user ID of the target process.

Name

function::is_myproc — Determines if the current probe point has occurred in the user's own process

Synopsis

```
is_myproc:long()
```

Arguments

None

Description

This function returns 1 if the current probe point has occurred in the user's own process.

Name

function::cpu — Returns the current cpu number

Synopsis

```
cpu:long()
```

Arguments

None

Description

This function returns the current cpu number.

Name

function::pp — Returns the active probe point

Synopsis

```
pp:string()
```

Arguments

None

Description

This function returns the fully-resolved probe point associated with a currently running probe handler, including alias and wild-card expansion effects. Context: The current probe point.

Name

function::registers_valid — Determines validity of `register` and `u_register` in current context

Synopsis

```
registers_valid:long()
```

Arguments

None

Description

This function returns 1 if `register` and `u_register` can be used in the current context, or 0 otherwise. For example, `registers_valid` returns 0 when called from a begin or end probe.

Name

function::user_mode — Determines if probe point occurs in user-mode

Synopsis

```
user_mode:long()
```

Arguments

None

Description

Return 1 if the probe point occurred in user-mode.

Name

function::is_return — Whether the current probe context is a return probe

Synopsis

```
is_return:long()
```

Arguments

None

Description

Returns 1 if the current probe context is a return probe, returns 0 otherwise.

Name

function::target — Return the process ID of the target process

Synopsis

```
target:long()
```

Arguments

None

Description

This function returns the process ID of the target process. This is useful in conjunction with the -x PID or -c CMD command-line options to stap. An example of its use is to create scripts that filter on a specific process.

-x <pid> `target` returns the pid specified by -x -c <command> `target` returns the pid for the executed command specified by -c

Name

function::module_name — The module name of the current script

Synopsis

```
module_name:string()
```

Arguments

None

Description

This function returns the name of the stap module. Either generated randomly (stap_[0-9a-f]+_[0-9a-f]+) or set by stap -m <module_name>.

Name

function::stp_pid — The process id of the stapio process

Synopsis

```
stp_pid:long()
```

Arguments

None

Description

This function returns the process id of the stapio process that launched this script. There could be other SystemTap scripts and stapio processes running on the system.

Name

function::stack_size — Return the size of the kernel stack

Synopsis

```
stack_size:long()
```

Arguments

None

Description

This function returns the size of the kernel stack.

Name

function::stack_used — Returns the amount of kernel stack used

Synopsis

```
stack_used:long()
```

Arguments

None

Description

This function determines how many bytes are currently used in the kernel stack.

Name

function::stack_unused — Returns the amount of kernel stack currently available

Synopsis

```
stack_unused:long()
```

Arguments

None

Description

This function determines how many bytes are currently available in the kernel stack.

Name

function::uaddr — User space address of current running task (EXPERIMENTAL)

Synopsis

```
uaddr:long()
```

Arguments

None

Description

Returns the address in userspace that the current task was at when the probe occurred. When the current running task isn't a user space thread, or the address cannot be found, zero is returned. Can be used to see where the current task is combined with `usymname` or `symdata`. Often the task will be in the VDSO where it entered the kernel. FIXME - need VDSO tracking support #10080.

Name

function::cmdline_args — Fetch command line arguments from current process

Synopsis

```
cmdline_args:string(n:long,m:long,delim:string)
```

Arguments

n	First argument to get (zero is the command itself)
m	Last argument to get (or minus one for all arguments after n)
delim	String to use to delimit arguments when more than one.

Description

Returns arguments from the current process starting with argument number n, up to argument m. If there are less than n arguments, or the arguments cannot be retrieved from the current process, the empty string is returned. If m is smaller than n then all arguments starting from argument n are returned. Argument zero is traditionally the command itself.

Name

function::cmdline_arg — Fetch a command line argument

Synopsis

```
cmdline_arg:string(n:long)
```

Arguments

n Argument to get (zero is the command itself)

Description

Returns argument the requested argument from the current process or the empty string when there are not that many arguments or there is a problem retrieving the argument. Argument zero is traditionally the command itself.

Name

function::cmdline_str — Fetch all command line arguments from current process

Synopsis

```
cmdline_str:string()
```

Arguments

None

Description

Returns all arguments from the current process delimited by spaces. Returns the empty string when the arguments cannot be retrieved.

Name

function::env_var — Fetch environment variable from current process

Synopsis

```
env_var:string(name:string)
```

Arguments

name	Name of the environment variable to fetch

Description

Returns the contents of the specified environment value for the current process. If the variable isn't set an empty string is returned.

Name

function::print_stack — Print out kernel stack from string

Synopsis

```
print_stack(stk:string)
```

Arguments

stk String with list of hexadecimal addresses

Description

This function performs a symbolic lookup of the addresses in the given string, which is assumed to be the result of a prior call to `backtrace`.

Print one line per address, including the address, the name of the function containing the address, and an estimate of its position within that function. Return nothing.

Name

function::sprint_stack — Return stack for kernel addresses from string (EXPERIMENTAL)

Synopsis

```
sprint_stack:string(stk:string)
```

Arguments

stk String with list of hexadecimal (kernel) addresses

Description

Perform a symbolic lookup of the addresses in the given string, which is assumed to be the result of a prior call to `backtrace`.

Returns a simple backtrace from the given hex string. One line per address. Includes the symbol name (or hex address if symbol couldn't be resolved) and module name (if found). Includes the offset from the start of the function if found, otherwise the offset will be added to the module (if found, between brackets). Returns the backtrace as string (each line terminated by a newline character). Note that the returned stack will be truncated to MAXSTRINGLEN, to print fuller and richer stacks use print_stack.

Name

function::probefunc — Return the probe point's function name, if known

Synopsis

```
probefunc:string()
```

Arguments

None

Description

This function returns the name of the function being probed. It will do this based on the probe point string as returned by `pp`.

Please note

this function is deprecated, please use `symname` and/or `usymname`. This function might return a function name based on the current address if the probe point context couldn't be parsed.

Name

function::probemod — Return the probe point's kernel module name

Synopsis

```
probemod:string()
```

Arguments

None

Description

This function returns the name of the kernel module containing the probe point, if known.

Name

function::modname — Return the kernel module name loaded at the address

Synopsis

```
modname:string(addr:long)
```

Arguments

addr The address to map to a kernel module name

Description

Returns the module name associated with the given address if known. If not known it will return the string “<unknown>”. If the address was not in a kernel module, but in the kernel itself, then the string “kernel” will be returned.

Name

function::symname — Return the kernel symbol associated with the given address

Synopsis

```
symname:string(addr:long)
```

Arguments

addr The address to translate

Description

Returns the (function) symbol name associated with the given address if known. If not known it will return the hex string representation of addr.

Name

function::symdata — Return the kernel symbol and module offset for the address

Synopsis

```
symdata:string(addr:long)
```

Arguments

addr The address to translate

Description

Returns the (function) symbol name associated with the given address if known, the offset from the start and size of the symbol, plus module name (between brackets). If symbol is unknown, but module is known, the offset inside the module, plus the size of the module is added. If any element is not known it will be omitted and if the symbol name is unknown it will return the hex string for the given address.

Name

function::umodname — Returns the (short) name of the user module. EXPERIMENTAL!

Synopsis

```
umodname:string(addr:long)
```

Arguments

addr User-space address

Description

Returns the short name of the user space module for the current task that that the given address is part of. Returns "<unknown>" when the address isn't in a (mapped in) module, or the module cannot be found for some reason.

Name

function::usymname — Return the symbol of an address in the current task. EXPERIMENTAL!

Synopsis

```
usymname:string(addr:long)
```

Arguments

addr The address to translate.

Description

Returns the (function) symbol name associated with the given address if known. If not known it will return the hex string representation of addr.

Name

function::usymdata — Return the symbol and module offset of an address. EXPERIMENTAL!

Synopsis

```
usymdata:string(addr:long)
```

Arguments

addr The address to translate.

Description

Returns the (function) symbol name associated with the given address in the current task if known, the offset from the start and the size of the symbol, plus the module name (between brackets). If symbol is unknown, but module is known, the offset inside the module, plus the size of the module is added. If any element is not known it will be omitted and if the symbol name is unknown it will return the hex string for the given address.

Name

function::print_ustack — Print out stack for the current task from string. EXPERIMENTAL!

Synopsis

```
print_ustack(stk:string)
```

Arguments

stk String with list of hexadecimal addresses for the current task.

Description

Perform a symbolic lookup of the addresses in the given string, which is assumed to be the result of a prior call to `ubacktrace` for the current task.

Print one line per address, including the address, the name of the function containing the address, and an estimate of its position within that function. Return nothing.

Name

function::sprint_ustack — Return stack for the current task from string. EXPERIMENTAL!

Synopsis

```
sprint_ustack:string(stk:string)
```

Arguments

stk String with list of hexadecimal addresses for the current task.

Description

Perform a symbolic lookup of the addresses in the given string, which is assumed to be the result of a prior call to `ubacktrace` for the current task.

Returns a simple backtrace from the given hex string. One line per address. Includes the symbol name (or hex address if symbol couldn't be resolved) and module name (if found). Includes the offset from the start of the function if found, otherwise the offset will be added to the module (if found, between brackets). Returns the backtrace as string (each line terminated by a newline character). Note that the returned stack will be truncated to MAXSTRINGLEN, to print fuller and richer stacks use print_ustack.

Name

function::print_backtrace — Print stack back trace

Synopsis

```
print_backtrace()
```

Arguments

None

Description

This function isEquivalent to print_stack(`backtrace`), except that deeper stack nesting may be supported. The function does not return a value.

Name

function::sprint_backtrace — Return stack back trace as string (EXPERIMENTAL)

Synopsis

```
sprint_backtrace:string()
```

Arguments

None

Description

Returns a simple (kernel) backtrace. One line per address. Includes the symbol name (or hex address if symbol couldn't be resolved) and module name (if found). Includes the offset from the start of the function if found, otherwise the offset will be added to the module (if found, between brackets). Returns the backtrace as string (each line terminated by a newline character). Note that the returned stack will be truncated to MAXSTRINGLEN, to print fuller and richer stacks use `print_backtrace`. Equivalent to sprint_stack(`backtrace`), but more efficient (no need to translate between hex strings and final backtrace string).

Name

function::backtrace — Hex backtrace of current stack

Synopsis

```
backtrace:string()
```

Arguments

None

Description

This function returns a string of hex addresses that are a backtrace of the stack. Output may be truncated as as per maximum string length (MAXSTRINGLEN).

Name

function::task_backtrace — Hex backtrace of an arbitrary task

Synopsis

```
task_backtrace:string(task:long)
```

Arguments

task pointer to task_struct

Description

This function returns a string of hex addresses that are a backtrace of the stack of a particular task Output may be truncated as per maximum string length.

Name

function::caller — Return name and address of calling function

Synopsis

```
caller:string()
```

Arguments

None

Description

This function returns the address and name of the calling function. This is equivalent to calling: sprintf("s 0xx", symname(caller_addr, caller_addr)) Works only for return probes at this time.

Name

function::caller_addr — Return caller address

Synopsis

```
caller_addr:long()
```

Arguments

None

Description

This function returns the address of the calling function. Works only for return probes at this time.

Name

function::print_ubacktrace — Print stack back trace for current task. EXPERIMENTAL!

Synopsis

```
print_ubacktrace()
```

Arguments

None

Description

Equivalent to print_ustack(`ubacktrace`), except that deeper stack nesting may be supported. Returns nothing.

Note

To get (full) backtraces for user space applications and shared shared libraries not mentioned in the current script run stap with -d /path/to/exe-or-so and/or add --ldd to load all needed unwind data.

Name

function::sprint_ubacktrace — Return stack back trace for current task as string. EXPERIMENTAL!

Synopsis

```
sprint_ubacktrace:string()
```

Arguments

None

Description

Returns a simple backtrace for the current task. One line per address. Includes the symbol name (or hex address if symbol couldn't be resolved) and module name (if found). Includes the offset from the start of the function if found, otherwise the offset will be added to the module (if found, between brackets). Returns the backtrace as string (each line terminated by a newline character). Note that the returned stack will be truncated to MAXSTRINGLEN, to print fuller and richer stacks use `print_ubacktrace`. Equivalent to sprint_ustack(`ubacktrace`), but more efficient (no need to translate between hex strings and final backtrace string).

Note

To get (full) backtraces for user space applications and shared shared libraries not mentioned in the current script run stap with -d /path/to/exe-or-so and/or add --ldd to load all needed unwind data.

Name

function::print_ubacktrace_brief — Print stack back trace for current task. EXPERIMENTAL!

Synopsis

```
print_ubacktrace_brief()
```

Arguments

None

Description

Equivalent to `print_ubacktrace`, but output for each symbol is shorter (just name and offset, or just the hex address of no symbol could be found).

Note

To get (full) backtraces for user space applications and shared shared libraries not mentioned in the current script run stap with -d /path/to/exe-or-so and/or add --ldd to load all needed unwind data.

Name

function::ubacktrace — Hex backtrace of current task stack. EXPERIMENTAL!

Synopsis

```
ubacktrace:string()
```

Arguments

None

Description

Return a string of hex addresses that are a backtrace of the stack of the current task. Output may be truncated as per maximum string length. Returns empty string when current probe point cannot determine user backtrace.

Note

To get (full) backtraces for user space applications and shared shared libraries not mentioned in the current script run stap with -d /path/to/exe-or-so and/or add --ldd to load all needed unwind data.

Name

function::task_current — The current task_struct of the current task

Synopsis

```
task_current:long()
```

Arguments

None

Description

This function returns the task_struct representing the current process. This address can be passed to the various task_*() functions to extract more task-specific data.

Name

function::task_parent — The task_struct of the parent task

Synopsis

```
task_parent:long(task:long)
```

Arguments

task task_struct pointer

Description

This function returns the parent task_struct of the given task. This address can be passed to the various task_*() functions to extract more task-specific data.

Name

function::task_state — The state of the task

Synopsis

```
task_state:long(task:long)
```

Arguments

task task_struct pointer

Description

Return the state of the given task, one of: TASK_RUNNING (0), TASK_INTERRUPTIBLE (1), TASK_UNINTERRUPTIBLE (2), TASK_STOPPED (4), TASK_TRACED (8), EXIT_ZOMBIE (16), or EXIT_DEAD (32).

Name

function::task_execname — The name of the task

Synopsis

```
task_execname:string(task:long)
```

Arguments

task task_struct pointer

Description

Return the name of the given task.

Name

function::task_pid — The process identifier of the task

Synopsis

```
task_pid:long(task:long)
```

Arguments

task task_struct pointer

Description

This fucntion returns the process id of the given task.

Name

function::pid2task — The task_struct of the given process identifier

Synopsis

```
pid2task:long(pid:long)
```

Arguments

pid process identifier

Description

Return the task struct of the given process id.

Name

function::pid2execname — The name of the given process identifier

Synopsis

```
pid2execname:string(pid:long)
```

Arguments

pid process identifier

Description

Return the name of the given process id.

Name

function::task_tid — The thread identifier of the task

Synopsis

```
task_tid:long(task:long)
```

Arguments

task task_struct pointer

Description

This function returns the thread id of the given task.

Name

function::task_gid — The group identifier of the task

Synopsis

```
task_gid:long(task:long)
```

Arguments

task task_struct pointer

Description

This function returns the group id of the given task.

Name

function::task_egid — The effective group identifier of the task

Synopsis

```
task_egid:long(task:long)
```

Arguments

task task_struct pointer

Description

This function returns the effective group id of the given task.

Name

function::task_uid — The user identifier of the task

Synopsis

```
task_uid:long(task:long)
```

Arguments

task task_struct pointer

Description

This function returns the user id of the given task.

Name

function::task_euid — The effective user identifier of the task

Synopsis

```
task_euid:long(task:long)
```

Arguments

task task_struct pointer

Description

This function returns the effective user id of the given task.

Name

function::task_prio — The priority value of the task

Synopsis

```
task_prio:long(task:long)
```

Arguments

task task_struct pointer

Description

This function returns the priority value of the given task.

Name

function::task_nice — The nice value of the task

Synopsis

```
task_nice:long(task:long)
```

Arguments

task task_struct pointer

Description

This function returns the nice value of the given task.

Name

function::task_cpu — The scheduled cpu of the task

Synopsis

```
task_cpu:long(task:long)
```

Arguments

task task_struct pointer

Description

This function returns the scheduled cpu for the given task.

Name

function::task_open_file_handles — The number of open files of the task

Synopsis

```
task_open_file_handles:long(task:long)
```

Arguments

task task_struct pointer

Description

This function returns the number of open file handlers for the given task.

Name

function::task_max_file_handles — The max number of open files for the task

Synopsis

```
task_max_file_handles:long(task:long)
```

Arguments

task task_struct pointer

Description

This function returns the maximum number of file handlers for the given task.

Name

function::pn — Returns the active probe name

Synopsis

```
pn:string()
```

Arguments

None

Description

This function returns the script-level probe point associated with a currently running probe handler, including wild-card expansion effects. Context: The current probe point.

Chapter 3. Timestamp Functions

Each timestamp function returns a value to indicate when a function is executed. These returned values can then be used to indicate when an event occurred, provide an ordering for events, or compute the amount of time elapsed between two time stamps.

Name

function::get_cycles — Processor cycle count

Synopsis

```
get_cycles:long()
```

Arguments

None

Description

This function returns the processor cycle counter value if available, else it returns zero. The cycle counter is free running and unsynchronized on each processor. Thus, the order of events cannot determined by comparing the results of the get_cycles function on different processors.

Name

function::gettimeofday_ns — Number of nanoseconds since UNIX epoch

Synopsis

```
gettimeofday_ns:long()
```

Arguments

None

Description

This function returns the number of nanoseconds since the UNIX epoch.

Name

function::gettimeofday_us — Number of microseconds since UNIX epoch

Synopsis

```
gettimeofday_us:long()
```

Arguments

None

Description

This function returns the number of microseconds since the UNIX epoch.

Name

function::gettimeofday_ms — Number of milliseconds since UNIX epoch

Synopsis

```
gettimeofday_ms:long()
```

Arguments

None

Description

This function returns the number of milliseconds since the UNIX epoch.

Name

function::gettimeofday_s — Number of seconds since UNIX epoch

Synopsis

```
gettimeofday_s:long()
```

Arguments

None

Description

This function returns the number of seconds since the UNIX epoch.

Chapter 4. Time utility functions

Utility functions to turn seconds since the epoch (as returned by the timestamp function gettimeofday_s()) into a human readable date/time strings.

Name

function::ctime — Convert seconds since epoch into human readable date/time string

Synopsis

```
ctime:string(epochsecs:long)
```

Arguments

epochsecs	Number of seconds since epoch (as returned by `gettimeofday_s`)

Description

Takes an argument of seconds since the epoch as returned by `gettimeofday_s`. Returns a string of the form

"Wed Jun 30 21:49:08 1993"

The string will always be exactly 24 characters. If the time would be unreasonable far in the past (before what can be represented with a 32 bit offset in seconds from the epoch) the returned string will be "a long, long time ago...". If the time would be unreasonable far in the future the returned string will be "far far in the future..." (both these strings are also 24 characters wide).

Note that the epoch (zero) corresponds to

"Thu Jan 1 00:00:00 1970"

The earliest full date given by ctime, corresponding to epochsecs -2147483648 is "Fri Dec 13 20:45:52 1901". The latest full date given by ctime, corresponding to epochsecs 2147483647 is "Tue Jan 19 03:14:07 2038".

The abbreviations for the days of the week are 'Sun', 'Mon', 'Tue', 'Wed', 'Thu', 'Fri', and 'Sat'. The abbreviations for the months are 'Jan', 'Feb', 'Mar', 'Apr', 'May', 'Jun', 'Jul', 'Aug', 'Sep', 'Oct', 'Nov', and 'Dec'.

Note that the real C library `ctime` function puts a newline ('\n') character at the end of the string that this function does not. Also note that since the kernel has no concept of timezones, the returned time is always in GMT.

Name

function::tz_gmtoff — Return local time zone offset

Synopsis

```
tz_gmtoff()
```

Arguments

None

Description

Returns the local time zone offset (seconds west of UTC), as passed by staprun at script startup only.

Name

function::tz_name — Return local time zone name

Synopsis

```
tz_name()
```

Arguments

None

Description

Returns the local time zone name, as passed by staprun at script startup only.

Name

function::tz_ctime — Convert seconds since epoch into human readable date/time string, with local time zone

Synopsis

```
tz_ctime(epochsecs:)
```

Arguments

epochsecs	number of seconds since epoch (as returned by `gettimeofday_s`)

Description

Takes an argument of seconds since the epoch as returned by `gettimeofday_s`. Returns a string of the same form as `ctime`, but offsets the epoch time for the local time zone, and appends the name of the local time zone. The string length may vary. The time zone information is passed by staprun at script startup only.

Chapter 5. Memory Tapset

This family of probe points is used to probe memory-related events or query the memory usage of the current process. It contains the following probe points:

Name

function::vm_fault_contains — Test return value for page fault reason

Synopsis

```
vm_fault_contains:long(value:long,test:long)
```

Arguments

value	the fault_type returned by vm.page_fault.return
test	the type of fault to test for (VM_FAULT_OOM or similar)

Name

probe::vm.pagefault — Records that a page fault occurred

Synopsis

```
vm.pagefault
```

Values

write_access indicates whether this was a write or read access; 1 indicates a write, while 0 indicates a read

name name of the probe point

address the address of the faulting memory access; i.e. the address that caused the page fault

Context

The process which triggered the fault

Name

probe::vm.pagefault.return — Indicates what type of fault occurred

Synopsis

```
vm.pagefault.return
```

Values

name name of the probe point

fault_type returns either 0 (VM_FAULT_OOM) for out of memory faults, 2 (VM_FAULT_MINOR) for minor faults, 3 (VM_FAULT_MAJOR) for major faults, or 1 (VM_FAULT_SIGBUS) if the fault was neither OOM, minor fault, nor major fault.

Name

function::addr_to_node — Returns which node a given address belongs to within a NUMA system

Synopsis

```
addr_to_node:long(addr:long)
```

Arguments

addr the address of the faulting memory access

Description

This function accepts an address, and returns the node that the given address belongs to in a NUMA system.

Name

probe::vm.write_shared — Attempts at writing to a shared page

Synopsis

```
vm.write_shared
```

Values

name	name of the probe point
address	the address of the shared write

Context

The context is the process attempting the write.

Description

Fires when a process attempts to write to a shared page. If a copy is necessary, this will be followed by a vm.write_shared_copy.

Name

probe::vm.write_shared_copy — Page copy for shared page write

Synopsis

```
vm.write_shared_copy
```

Values

name	Name of the probe point
zero	boolean indicating whether it is a zero page (can do a clear instead of a copy)
address	The address of the shared write

Context

The process attempting the write.

Description

Fires when a write to a shared page requires a page copy. This is always preceded by a vm.shared_write.

Name

probe::vm.mmap — Fires when an mmap is requested

Synopsis

```
vm.mmap
```

Values

length	the length of the memory segment
name	name of the probe point
address	the requested address

Context

The process calling mmap.

Name

probe::vm.munmap — Fires when an munmap is requested

Synopsis

```
vm.munmap
```

Values

length	the length of the memory segment
name	name of the probe point
address	the requested address

Context

The process calling munmap.

Name

probe::vm.brk — Fires when a brk is requested (i.e. the heap will be resized)

Synopsis

```
vm.brk
```

Values

length	the length of the memory segment
name	name of the probe point
address	the requested address

Context

The process calling brk.

Name

probe::vm.oom_kill — Fires when a thread is selected for termination by the OOM killer

Synopsis

```
vm.oom_kill
```

Values

name	name of the probe point
task	the task being killed

Context

The process that tried to consume excessive memory, and thus triggered the OOM.

Name

probe::vm.kmalloc — Fires when kmalloc is requested

Synopsis

```
vm.kmalloc
```

Values

ptr	pointer to the kmemory allocated
caller_function	name of the caller function
call_site	address of the kmemory function
gfp_flag_name	type of kmemory to allocate (in String format)
name	name of the probe point
bytes_req	requested Bytes
bytes_alloc	allocated Bytes
gfp_flags	type of kmemory to allocate

Name

probe::vm.kmem_cache_alloc — Fires when kmem_cache_alloc is requested

Synopsis

```
vm.kmem_cache_alloc
```

Values

ptr	pointer to the kmemory allocated
caller_function	name of the caller function.
call_site	address of the function calling this kmemory function.
gfp_flag_name	type of kmemory to allocate(in string format)
name	name of the probe point
bytes_req	requested Bytes
bytes_alloc	allocated Bytes
gfp_flags	type of kmemory to allocate

Name

probe::vm.kmalloc_node — Fires when kmalloc_node is requested

Synopsis

```
vm.kmalloc_node
```

Values

ptr	pointer to the kmemory allocated
caller_function	name of the caller function
call_site	address of the function caling this kmemory function
gfp_flag_name	type of kmemory to allocate(in string format)
name	name of the probe point
bytes_req	requested Bytes
bytes_alloc	allocated Bytes
gfp_flags	type of kmemory to allocate

Name

probe::vm.kmem_cache_alloc_node — Fires when kmem_cache_alloc_node is requested

Synopsis

```
vm.kmem_cache_alloc_node
```

Values

ptr	pointer to the kmemory allocated
caller_function	name of the caller function
call_site	address of the function calling this kmemory function
gfp_flag_name	type of kmemory to allocate(in string format)
name	name of the probe point
bytes_req	requested Bytes
bytes_alloc	allocated Bytes
gfp_flags	type of kmemory to allocate

Name

probe::vm.kfree — Fires when kfree is requested

Synopsis

```
vm.kfree
```

Values

ptr	pointer to the kmemory allocated which is returned by kmalloc
caller_function	name of the caller function.
call_site	address of the function calling this kmemory function
name	name of the probe point

Name

probe::vm.kmem_cache_free — Fires when kmem_cache_free is requested

Synopsis

```
vm.kmem_cache_free
```

Values

ptr	Pointer to the kmemory allocated which is returned by kmem_cache
caller_function	Name of the caller function.
call_site	Address of the function calling this kmemory function
name	Name of the probe point

Name

function::proc_mem_size — Total program virtual memory size in pages

Synopsis

```
proc_mem_size:long()
```

Arguments

None

Description

Returns the total virtual memory size in pages of the current process, or zero when there is no current process or the number of pages couldn't be retrieved.

Name

function::proc_mem_size_pid — Total program virtual memory size in pages

Synopsis

```
proc_mem_size_pid:long(pid:long)
```

Arguments

pid The pid of process to examine

Description

Returns the total virtual memory size in pages of the given process, or zero when that process doesn't exist or the number of pages couldn't be retrieved.

Name

function::proc_mem_rss — Program resident set size in pages

Synopsis

```
proc_mem_rss:long()
```

Arguments

None

Description

Returns the resident set size in pages of the current process, or zero when there is no current process or the number of pages couldn't be retrieved.

Name

function::proc_mem_rss_pid — Program resident set size in pages

Synopsis

```
proc_mem_rss_pid:long(pid:long)
```

Arguments

pid The pid of process to examine

Description

Returns the resident set size in pages of the given process, or zero when the process doesn't exist or the number of pages couldn't be retrieved.

Name

function::proc_mem_shr — Program shared pages (from shared mappings)

Synopsis

```
proc_mem_shr:long()
```

Arguments

None

Description

Returns the shared pages (from shared mappings) of the current process, or zero when there is no current process or the number of pages couldn't be retrieved.

Name

function::proc_mem_shr_pid — Program shared pages (from shared mappings)

Synopsis

```
proc_mem_shr_pid:long(pid:long)
```

Arguments

pid The pid of process to examine

Description

Returns the shared pages (from shared mappings) of the given process, or zero when the process doesn't exist or the number of pages couldn't be retrieved.

Name

function::proc_mem_txt — Program text (code) size in pages

Synopsis

```
proc_mem_txt:long()
```

Arguments

None

Description

Returns the current process text (code) size in pages, or zero when there is no current process or the number of pages couldn't be retrieved.

Name

function::proc_mem_txt_pid — Program text (code) size in pages

Synopsis

```
proc_mem_txt_pid:long(pid:long)
```

Arguments

pid The pid of process to examine

Description

Returns the given process text (code) size in pages, or zero when the process doesn't exist or the number of pages couldn't be retrieved.

Name

function::proc_mem_data — Program data size (data + stack) in pages

Synopsis

```
proc_mem_data:long()
```

Arguments

None

Description

Returns the current process data size (data + stack) in pages, or zero when there is no current process or the number of pages couldn't be retrieved.

Name

function::proc_mem_data_pid — Program data size (data + stack) in pages

Synopsis

```
proc_mem_data_pid:long(pid:long)
```

Arguments

pid The pid of process to examine

Description

Returns the given process data size (data + stack) in pages, or zero when the process doesn't exist or the number of pages couldn't be retrieved.

Name

function::mem_page_size — Number of bytes in a page for this architecture

Synopsis

```
mem_page_size:long()
```

Arguments

None

Name

function::bytes_to_string — Human readable string for given bytes

Synopsis

```
bytes_to_string:string(bytes:long)
```

Arguments

bytes Number of bytes to translate.

Description

Returns a string representing the number of bytes (up to 1024 bytes), the number of kilobytes (when less than 1024K) postfixed by 'K', the number of megabytes (when less than 1024M) postfixed by 'M' or the number of gigabytes postfixed by 'G'. If representing K, M or G, and the number is amount is less than 100, it includes a '.' plus the remainer. The returned string will be 5 characters wide (padding with whitespace at the front) unless negative or representing more than 9999G bytes.

Name

function::pages_to_string — Turns pages into a human readable string

Synopsis

```
pages_to_string:string(pages:long)
```

Arguments

pages Number of pages to translate.

Description

Multiplies pages by `page_size` to get the number of bytes and returns the result of `bytes_to_string`.

Name

function::proc_mem_string — Human readable string of current proc memory usage

Synopsis

```
proc_mem_string:string()
```

Arguments

None

Description

Returns a human readable string showing the size, rss, shr, txt and data of the memory used by the current process. For example “size: 301m, rss: 11m, shr: 8m, txt: 52k, data: 2248k”.

Name

function::proc_mem_string_pid — Human readable string of process memory usage

Synopsis

```
proc_mem_string_pid:string(pid:long)
```

Arguments

pid The pid of process to examine

Description

Returns a human readable string showing the size, rss, shr, txt and data of the memory used by the given process. For example “size: 301m, rss: 11m, shr: 8m, txt: 52k, data: 2248k”.

Chapter 6. Task Time Tapset

This tapset defines utility functions to query time related properties of the current tasks, translate those in miliseconds and human readable strings.

Name

function::task_utime — User time of the current task

Synopsis

```
task_utime:long()
```

Arguments

None

Description

Returns the user time of the current task in cputime. Does not include any time used by other tasks in this process, nor does it include any time of the children of this task.

Name

function::task_utime_tid — User time of the given task

Synopsis

```
task_utime_tid:long(tid:long)
```

Arguments

tid Thread id of the given task

Description

Returns the user time of the given task in cputime, or zero if the task doesn't exist. Does not include any time used by other tasks in this process, nor does it include any time of the children of this task.

Name

function::task_stime — System time of the current task

Synopsis

```
task_stime:long()
```

Arguments

None

Description

Returns the system time of the current task in cputime. Does not include any time used by other tasks in this process, nor does it include any time of the children of this task.

Name

function::task_stime_tid — System time of the given task

Synopsis

```
task_stime_tid:long(tid:long)
```

Arguments

tid Thread id of the given task

Description

Returns the system time of the given task in cputime, or zero if the task doesn't exist. Does not include any time used by other tasks in this process, nor does it include any time of the children of this task.

Name

function::cputime_to_msecs — Translates the given cputime into milliseconds

Synopsis

```
cputime_to_msecs:long(cputime:long)
```

Arguments

cputime	Time to convert to milliseconds.

Name

function::msecs_to_string — Human readable string for given milliseconds

Synopsis

```
msecs_to_string:string(msecs:long)
```

Arguments

msecs Number of milliseconds to translate.

Description

Returns a string representing the number of milliseconds as a human readable string consisting of "XmY.ZZZs", where X is the number of minutes, Y is the number of seconds and ZZZ is the number of milliseconds.

Name

function::cputime_to_string — Human readable string for given cputime

Synopsis

```
cputime_to_string:string(cputime:long)
```

Arguments

cputime Time to translate.

Description

Equivalent to calling: msec_to_string (cputime_to_msecs (cputime).

Name

function::task_time_string — Human readable string of task time usage

Synopsis

```
task_time_string:string()
```

Arguments

None

Description

Returns a human readable string showing the user and system time the current task has used up to now. For example “usr: 0m12.908s, sys: 1m6.851s”.

Name

function::task_time_string_tid — Human readable string of task time usage

Synopsis

```
task_time_string_tid:string(tid:long)
```

Arguments

tid Thread id of the given task

Description

Returns a human readable string showing the user and system time the given task has used up to now. For example “usr: 0m12.908s, sys: 1m6.851s”.

Chapter 7. Scheduler Tapset

This family of probe points is used to probe the task scheduler activities. It contains the following probe points:

Name

probe::scheduler.ctxswitch — A context switch is occuring.

Synopsis

```
scheduler.ctxswitch
```

Values

prev_pid	The PID of the process to be switched out
name	name of the probe point
next_task_name	The name of the process to be switched in
nexttsk_state	the state of the process to be switched in
prev_priority	The priority of the process to be switched out
next_pid	The PID of the process to be switched in
next_priority	The priority of the process to be switched in
prevtsk_state	the state of the process to be switched out
next_tid	The TID of the process to be switched in
prev_task_name	The name of the process to be switched out
prev_tid	The TID of the process to be switched out

Description

Currently, SystemTap can't access arguments of inline functions. So we choose to probe __switch_to instead of `context_switch`

Name

probe::scheduler.kthread_stop — A thread created by kthread_create is being stopped

Synopsis

```
scheduler.kthread_stop
```

Values

thread_priority	priority of the thread
thread_pid	PID of the thread being stopped

Name

probe::scheduler.kthread_stop.return — A kthread is stopped and gets the return value

Synopsis

```
scheduler.kthread_stop.return
```

Values

return_value	return value after stopping the thread
name	name of the probe point

Name

probe::scheduler.wait_task — Waiting on a task to unschedule (become inactive)

Synopsis

```
scheduler.wait_task
```

Values

name	name of the probe point
task_pid	PID of the task the scheduler is waiting on
task_priority	priority of the task

Name

probe::scheduler.wakeup — Task is woken up

Synopsis

```
scheduler.wakeup
```

Values

task_cpu	cpu of the task being woken up
name	name of the probe point
task_pid	PID of the task being woken up
task_priority	priority of the task being woken up
task_state	state of the task being woken up
task_tid	tid of the task being woken up

Name

probe::scheduler.wakeup_new — Newly created task is woken up for the first time

Synopsis

```
scheduler.wakeup_new
```

Values

task_cpu	cpu of the task woken up
name	name of the probe point
task_pid	PID of the new task woken up
task_priority	priority of the new task
task_state	state of the task woken up
task_tid	TID of the new task woken up

Name

probe::scheduler.migrate — Task migrating across cpus

Synopsis

```
scheduler.migrate
```

Values

priority	priority of the task being migrated
cpu_from	the original cpu
name	name of the probe point
task	the process that is being migrated
cpu_to	the destination cpu
pid	PID of the task being migrated

Name

probe::scheduler.process_free — Scheduler freeing a data structure for a process

Synopsis

```
scheduler.process_free
```

Values

priority	priority of the process getting freed
name	name of the probe point
pid	PID of the process getting freed

Name

probe::scheduler.process_exit — Process exiting

Synopsis

```
scheduler.process_exit
```

Values

priority	priority of the process exiting
name	name of the probe point
pid	PID of the process exiting

Name

probe::scheduler.process_wait — Scheduler starting to wait on a process

Synopsis

```
scheduler.process_wait
```

Values

name	name of the probe point
pid	PID of the process scheduler is waiting on

Name

probe::scheduler.process_fork — Process forked

Synopsis

```
scheduler.process_fork
```

Values

name	name of the probe point
parent_pid	PID of the parent process
child_pid	PID of the child process

Name

probe::scheduler.signal_send — Sending a signal

Synopsis

```
scheduler.signal_send
```

Values

signal_number	signal number
name	name of the probe point
pid	pid of the process sending signal

Chapter 8. IO Scheduler and block IO Tapset

This family of probe points is used to probe block IO layer and IO scheduler activities. It contains the following probe points:

Name

probe::ioscheduler.elv_next_request — Fires when a request is retrieved from the request queue

Synopsis

```
ioscheduler.elv_next_request
```

Values

name	Name of the probe point
elevator_name	The type of I/O elevator currently enabled

Name

probe::ioscheduler.elv_next_request.return — Fires when a request retrieval issues a return signal

Synopsis

```
ioscheduler.elv_next_request.return
```

Values

disk_major	Disk major number of the request
rq	Address of the request
name	Name of the probe point
disk_minor	Disk minor number of the request
rq_flags	Request flags

Name

probe::ioscheduler.elv_completed_request — Fires when a request is completed

Synopsis

```
ioscheduler.elv_completed_request
```

Values

disk_major	Disk major number of the request
rq	Address of the request
name	Name of the probe point
elevator_name	The type of I/O elevator currently enabled
disk_minor	Disk minor number of the request
rq_flags	Request flags

Name

probe::ioscheduler.elv_add_request.kp — kprobe based probe to indicate that a request was added to the request queue

Synopsis

```
ioscheduler.elv_add_request.kp
```

Values

disk_major	Disk major number of the request
rq	Address of the request
q	pointer to request queue
name	Name of the probe point
elevator_name	The type of I/O elevator currently enabled
disk_minor	Disk minor number of the request
rq_flags	Request flags

Name

probe::ioscheduler.elv_add_request.tp — tracepoint based probe to indicate a request is added to the request queue.

Synopsis

```
ioscheduler.elv_add_request.tp
```

Values

disk_major	Disk major no of request.
rq	Address of request.
q	Pointer to request queue.
name	Name of the probe point
elevator_name	The type of I/O elevator currently enabled.
disk_minor	Disk minor number of request.
rq_flags	Request flags.

Name

probe::ioscheduler.elv_add_request — probe to indicate request is added to the request queue.

Synopsis

```
ioscheduler.elv_add_request
```

Values

disk_major	Disk major no of request.
rq	Address of request.
q	Pointer to request queue.
elevator_name	The type of I/O elevator currently enabled.
disk_minor	Disk minor number of request.
rq_flags	Request flags.

Name

probe::ioscheduler_trace.elv_completed_request — Fires when a request is

Synopsis

```
ioscheduler_trace.elv_completed_request
```

Values

disk_major	Disk major no of request.
rq	Address of request.
name	Name of the probe point
elevator_name	The type of I/O elevator currently enabled.
disk_minor	Disk minor number of request.
rq_flags	Request flags.

Description

completed.

Name

probe::ioscheduler_trace.elv_issue_request — Fires when a request is

Synopsis

```
ioscheduler_trace.elv_issue_request
```

Values

disk_major	Disk major no of request.
rq	Address of request.
name	Name of the probe point
elevator_name	The type of I/O elevator currently enabled.
disk_minor	Disk minor number of request.
rq_flags	Request flags.

Description

scheduled.

Name

probe::ioscheduler_trace.elv_requeue_request — Fires when a request is

Synopsis

```
ioscheduler_trace.elv_requeue_request
```

Values

disk_major	Disk major no of request.
rq	Address of request.
name	Name of the probe point
elevator_name	The type of I/O elevator currently enabled.
disk_minor	Disk minor number of request.
rq_flags	Request flags.

Description

put back on the queue, when the hadware cannot accept more requests.

Name

probe::ioscheduler_trace.elv_abort_request — Fires when a request is aborted.

Synopsis

```
ioscheduler_trace.elv_abort_request
```

Values

disk_major	Disk major no of request.
rq	Address of request.
name	Name of the probe point
elevator_name	The type of I/O elevator currently enabled.
disk_minor	Disk minor number of request.
rq_flags	Request flags.

Name

probe::ioscheduler_trace.plug — Fires when a request queue is plugged;

Synopsis

```
ioscheduler_trace.plug
```

Values

name	Name of the probe point
rq_queue	request queue

Description

ie, requests in the queue cannot be serviced by block driver.

Name

probe::ioscheduler_trace.unplug_io — Fires when a request queue is unplugged;

Synopsis

```
ioscheduler_trace.unplug_io
```

Values

name	Name of the probe point
rq_queue	request queue

Description

Either, when number of pending requests in the queue exceeds threshold or, upon expiration of timer that was activated when queue was plugged.

Name

probe::ioscheduler_trace.unplug_timer — Fires when unplug timer associated

Synopsis

```
ioscheduler_trace.unplug_timer
```

Values

name	Name of the probe point
rq_queue	request queue

Description

with a request queue expires.

Name

probe::ioblock.request — Fires whenever making a generic block I/O request.

Synopsis

```
ioblock.request
```

Values

None

Description

name - name of the probe point *devname* - block device name *ino* - i-node number of the mapped file *sector* - beginning sector for the entire bio *flags* - see below BIO_UPTODATE 0 ok after I/O completion BIO_RW_BLOCK 1 RW_AHEAD set, and read/write would block BIO_EOF 2 out-out-bounds error BIO_SEG_VALID 3 nr_hw_seg valid BIO_CLONED 4 doesn't own data BIO_BOUNCED 5 bio is a bounce bio BIO_USER_MAPPED 6 contains user pages BIO_EOPNOTSUPP 7 not supported

rw - binary trace for read/write request *vcnt* - bio vector count which represents number of array element (page, offset, length) which make up this I/O request *idx* - offset into the bio vector array *phys_segments* - number of segments in this bio after physical address coalescing is performed *hw_segments* - number of segments after physical and DMA remapping hardware coalescing is performed *size* - total size in bytes *bdev* - target block device *bdev_contains* - points to the device object which contains the partition (when bio structure represents a partition) *p_start_sect* - points to the start sector of the partition structure of the device

Context

The process makes block I/O request

Name

probe::ioblock.end — Fires whenever a block I/O transfer is complete.

Synopsis

```
ioblock.end
```

Values

None

Description

name - name of the probe point *devname* - block device name *ino* - i-node number of the mapped file *bytes_done* - number of bytes transferred *sector* - beginning sector for the entire bio *flags* - see below BIO_UPTODATE 0 ok after I/O completion BIO_RW_BLOCK 1 RW_AHEAD set, and read/write would block BIO_EOF 2 out-out-bounds error BIO_SEG_VALID 3 nr_hw_seg valid BIO_CLONED 4 doesn't own data BIO_BOUNCED 5 bio is a bounce bio BIO_USER_MAPPED 6 contains user pages BIO_EOPNOTSUPP 7 not supported *error* - 0 on success *rw* - binary trace for read/write request *vcnt* - bio vector count which represents number of array element (page, offset, length) which makes up this I/O request *idx* - offset into the bio vector array *phys_segments* - number of segments in this bio after physical address coalescing is performed. *hw_segments* - number of segments after physical and DMA remapping hardware coalescing is performed *size* - total size in bytes

Context

The process signals the transfer is done.

Name

probe::ioblock_trace.bounce — Fires whenever a buffer bounce is needed for at least one page of a block IO request.

Synopsis

```
ioblock_trace.bounce
```

Values

None

Description

name - name of the probe point *q* - request queue on which this bio was queued. *devname* - device for which a buffer bounce was needed. *ino* - i-node number of the mapped file *bytes_done* - number of bytes transferred *sector* - beginning sector for the entire bio *flags* - see below BIO_UPTODATE 0 ok after I/O completion BIO_RW_BLOCK 1 RW_AHEAD set, and read/write would block BIO_EOF 2 out-out-bounds error BIO_SEG_VALID 3 nr_hw_seg valid BIO_CLONED 4 doesn't own data BIO_BOUNCED 5 bio is a bounce bio BIO_USER_MAPPED 6 contains user pages BIO_EOPNOTSUPP 7 not supported *rw* - binary trace for read/write request *vcnt* - bio vector count which represents number of array element (page, offset, length) which makes up this I/O request *idx* - offset into the bio vector array *phys_segments* - number of segments in this bio after physical address coalescing is performed. *size* - total size in bytes *bdev* - target block device *bdev_contains* - points to the device object which contains the partition (when bio structure represents a partition) *p_start_sect* - points to the start sector of the partition structure of the device

Context

The process creating a block IO request.

Name

probe::ioblock_trace.request — Fires just as a generic block I/O request is created for a bio.

Synopsis

```
ioblock_trace.request
```

Values

None

Description

name - name of the probe point *q* - request queue on which this bio was queued. *devname* - block device name *ino* - i-node number of the mapped file *bytes_done* - number of bytes transferred *sector* - beginning sector for the entire bio *flags* - see below BIO_UPTODATE 0 ok after I/O completion BIO_RW_BLOCK 1 RW_AHEAD set, and read/write would block BIO_EOF 2 out-out-bounds error BIO_SEG_VALID 3 nr_hw_seg valid BIO_CLONED 4 doesn't own data BIO_BOUNCED 5 bio is a bounce bio BIO_USER_MAPPED 6 contains user pages BIO_EOPNOTSUPP 7 not supported

rw - binary trace for read/write request *vcnt* - bio vector count which represents number of array element (page, offset, length) which make up this I/O request *idx* - offset into the bio vector array *phys_segments* - number of segments in this bio after physical address coalescing is performed. *size* - total size in bytes *bdev* - target block device *bdev_contains* - points to the device object which contains the partition (when bio structure represents a partition) *p_start_sect* - points to the start sector of the partition structure of the device

Context

The process makes block I/O request

Name

probe::ioblock_trace.end — Fires whenever a block I/O transfer is complete.

Synopsis

```
ioblock_trace.end
```

Values

None

Description

name - name of the probe point *q* - request queue on which this bio was queued. *devname* - block device name *ino* - i-node number of the mapped file *bytes_done* - number of bytes transferred *sector* - beginning sector for the entire bio *flags* - see below BIO_UPTODATE 0 ok after I/O completion BIO_RW_BLOCK 1 RW_AHEAD set, and read/write would block BIO_EOF 2 out-out-bounds error BIO_SEG_VALID 3 nr_hw_seg valid BIO_CLONED 4 doesn't own data BIO_BOUNCED 5 bio is a bounce bio BIO_USER_MAPPED 6 contains user pages BIO_EOPNOTSUPP 7 not supported

rw - binary trace for read/write request *vcnt* - bio vector count which represents number of array element (page, offset, length) which makes up this I/O request *idx* - offset into the bio vector array *phys_segments* - number of segments in this bio after physical address coalescing is performed. *size* - total size in bytes *bdev* - target block device *bdev_contains* - points to the device object which contains the partition (when bio structure represents a partition) *p_start_sect* - points to the start sector of the partition structure of the device

Context

The process signals the transfer is done.

Chapter 9. SCSI Tapset

This family of probe points is used to probe SCSI activities. It contains the following probe points:

Name

probe::scsi.ioentry — Prepares a SCSI mid-layer request

Synopsis

```
scsi.ioentry
```

Values

disk_major	The major number of the disk (-1 if no information)
device_state_str	The current state of the device, as a string
device_state	The current state of the device
req_addr	The current struct request pointer, as a number
disk_minor	The minor number of the disk (-1 if no information)

Name

probe::scsi.iodispatching — SCSI mid-layer dispatched low-level SCSI command

Synopsis

```
scsi.iodispatching
```

Values

device_state_str	The current state of the device, as a string
dev_id	The scsi device id
channel	The channel number
data_direction	The data_direction specifies whether this command is from/to the device 0 (DMA_BIDIRECTIONAL), 1 (DMA_TO_DEVICE), 2 (DMA_FROM_DEVICE), 3 (DMA_NONE)
lun	The lun number
request_bufflen	The request buffer length
host_no	The host number
device_state	The current state of the device
data_direction_str	Data direction, as a string
req_addr	The current struct request pointer, as a number
request_buffer	The request buffer address

Name

probe::scsi.iodone — SCSI command completed by low level driver and enqueued into the done queue.

Synopsis

```
scsi.iodone
```

Values

device_state_str	The current state of the device, as a string
dev_id	The scsi device id
channel	The channel number
data_direction	The data_direction specifies whether this command is from/to the device.
lun	The lun number
host_no	The host number
data_direction_str	Data direction, as a string
device_state	The current state of the device
scsi_timer_pending	1 if a timer is pending on this request
req_addr	The current struct request pointer, as a number

Name

probe::scsi.iocompleted — SCSI mid-layer running the completion processing for block device I/O requests

Synopsis

```
scsi.iocompleted
```

Values

device_state_str	The current state of the device, as a string
dev_id	The scsi device id
channel	The channel number
data_direction	The data_direction specifies whether this command is from/to the device
lun	The lun number
host_no	The host number
data_direction_str	Data direction, as a string
device_state	The current state of the device
req_addr	The current struct request pointer, as a number
goodbytes	The bytes completed

Name

probe::scsi.ioexecute — Create mid-layer SCSI request and wait for the result

Synopsis

```
scsi.ioexecute
```

Values

retries	Number of times to retry request
device_state_str	The current state of the device, as a string
dev_id	The scsi device id
channel	The channel number
data_direction	The data_direction specifies whether this command is from/to the device.
lun	The lun number
timeout	Request timeout in seconds
request_bufflen	The data buffer buffer length
host_no	The host number
data_direction_str	Data direction, as a string
device_state	The current state of the device
request_buffer	The data buffer address

Name

probe::scsi.set_state — Order SCSI device state change

Synopsis

```
scsi.set_state
```

Values

state_str	The new state of the device, as a string
dev_id	The scsi device id
channel	The channel number
state	The new state of the device
old_state_str	The current state of the device, as a string
lun	The lun number
old_state	The current state of the device
host_no	The host number

Chapter 10. TTY Tapset

This family of probe points is used to probe TTY (Teletype) activities. It contains the following probe points:

Name

probe::tty.open — Called when a tty is opened

Synopsis

```
tty.open
```

Values

inode_state	the inode state
file_name	the file name
file_mode	the file mode
file_flags	the file flags
inode_number	the inode number
inode_flags	the inode flags

Name

probe::tty.release — Called when the tty is closed

Synopsis

```
tty.release
```

Values

inode_state	the inode state
file_name	the file name
file_mode	the file mode
file_flags	the file flags
inode_number	the inode number
inode_flags	the inode flags

Name

probe::tty.resize — Called when a terminal resize happens

Synopsis

```
tty.resize
```

Values

new_ypixel	the new ypixel value
old_col	the old col value
old_xpixel	the old xpixel
old_ypixel	the old ypixel
name	the tty name
old_row	the old row value
new_row	the new row value
new_xpixel	the new xpixel value
new_col	the new col value

Name

probe::tty.ioctl — called when a ioctl is request to the tty

Synopsis

```
tty.ioctl
```

Values

cmd	the ioctl command
arg	the ioctl argument
name	the file name

Name

probe::tty.init — Called when a tty is being initalized

Synopsis

```
tty.init
```

Values

driver_name	the driver name
name	the driver .dev_name name
module	the module name

Name

probe::tty.register — Called when a tty device is registred

Synopsis

```
tty.register
```

Values

driver_name	the driver name
name	the driver .dev_name name
index	the tty index requested
module	the module name

Name

probe::tty.unregister — Called when a tty device is being unregistered

Synopsis

```
tty.unregister
```

Values

driver_name	the driver name
name	the driver .dev_name name
index	the tty index requested
module	the module name

Name

probe::tty.poll — Called when a tty device is being polled

Synopsis

```
tty.poll
```

Values

file_name	the tty file name
wait_key	the wait queue key

Name

probe::tty.receive — called when a tty receives a message

Synopsis

```
tty.receive
```

Values

driver_name	the driver name
count	The amount of characters received
name	the name of the module file
fp	The flag buffer
cp	the buffer that was received
index	The tty Index
id	the tty id

Name

probe::tty.write — write to the tty line

Synopsis

```
tty.write
```

Values

driver_name	the driver name
buffer	the buffer that will be written
file_name	the file name lreated to the tty
nr	The amount of characters

Name

probe::tty.read — called when a tty line will be read

Synopsis

```
tty.read
```

Values

driver_name	the driver name
buffer	the buffer that will receive the characters
file_name	the file name lreated to the tty
nr	The amount of characters to be read

Chapter 11. Interrupt Request (IRQ) Tapset

This family of probe points is used to probe interrupt request (IRQ) activities. It contains the following probe points:

Name

probe::workqueue.create — Creating a new workqueue

Synopsis

```
workqueue.create
```

Values

wq_thread	task_struct of the workqueue thread
cpu	cpu for which the worker thread is created

Name

probe::workqueue.insert — Queuing work on a workqueue

Synopsis

```
workqueue.insert
```

Values

wq_thread	task_struct of the workqueue thread
work_func	pointer to handler function
work	work_struct* being queued

Name

probe::workqueue.execute — Executing deferred work

Synopsis

```
workqueue.execute
```

Values

wq_thread	task_struct of the workqueue thread
work_func	pointer to handler function
work	work_struct* being executed

Name

probe::workqueue.destroy — Destroying workqueue

Synopsis

```
workqueue.destroy
```

Values

wq_thread task_struct of the workqueue thread

Name

probe::irq_handler.entry — Execution of interrupt handler starting

Synopsis

```
irq_handler.entry
```

Values

dev_name	name of device
flags	Flags for IRQ handler
dev_id	Cookie to identify device
dir	pointer to the proc/irq/NN/name entry
irq	irq number
next_irqaction	pointer to next irqaction for shared interrupts
thread_flags	Flags related to thread
thread	thread pointer for threaded interrupts
thread_fn	interrupt handler function for threaded interrupts
handler	interrupt handler function
flags_str	symbolic string representation of IRQ flags
action	struct irqaction* for this interrupt num

Name

probe::irq_handler.exit — Execution of interrupt handler completed

Synopsis

```
irq_handler.exit
```

Values

dev_name	name of device
ret	return value of the handler
flags	flags for IRQ handler
dev_id	Cookie to identify device
dir	pointer to the proc/irq/NN/name entry
next_irqaction	pointer to next irqaction for shared interrupts
irq	interrupt number
thread_flags	Flags related to thread
thread	thread pointer for threaded interrupts
thread_fn	interrupt handler function for threaded interrupts
flags_str	symbolic string representation of IRQ flags
handler	interrupt handler function that was executed
action	struct irqaction*

Name

probe::softirq.entry — Execution of handler for a pending softirq starting

Synopsis

```
softirq.entry
```

Values

vec	softirq_action vector
h	struct softirq_action* for current pending softirq
vec_nr	softirq vector number
action	pointer to softirq handler just about to execute

Name

probe::softirq.exit — Execution of handler for a pending softirq completed

Synopsis

```
softirq.exit
```

Values

vec	softirq_action vector
h	struct softirq_action* for just executed softirq
vec_nr	softirq vector number
action	pointer to softirq handler that just finished execution

Chapter 12. Networking Tapset

This family of probe points is used to probe the activities of the network device and protocol layers.

Name

probe::netdev.receive — Data received from network device.

Synopsis

```
netdev.receive
```

Values

protocol	Protocol of received packet.
dev_name	The name of the device. e.g: eth0, ath1.
length	The length of the receiving buffer.

Name

probe::netdev.transmit — Network device transmitting buffer

Synopsis

```
netdev.transmit
```

Values

protocol	The protocol of this packet(defined in include/linux/if_ether.h).
dev_name	The name of the device. e.g: eth0, ath1.
length	The length of the transmit buffer.
truesize	The size of the data to be transmitted.

Name

probe::netdev.change_mtu — Called when the netdev MTU is changed

Synopsis

```
netdev.change_mtu
```

Values

dev_name	The device that will have the MTU changed
new_mtu	The new MTU
old_mtu	The current MTU

Name

probe::netdev.open — Called when the device is opened

Synopsis

```
netdev.open
```

Values

dev_name	The device that is going to be opened

Name

probe::netdev.close — Called when the device is closed

Synopsis

```
netdev.close
```

Values

dev_name	The device that is going to be closed

Name

probe::netdev.hard_transmit — Called when the devices is going to TX (hard)

Synopsis

```
netdev.hard_transmit
```

Values

protocol	The protocol used in the transmission
dev_name	The device scheduled to transmit
length	The length of the transmit buffer.
truesize	The size of the data to be transmitted.

Name

probe::netdev.rx — Called when the device is going to receive a packet

Synopsis

```
netdev.rx
```

Values

protocol	The packet protocol
dev_name	The device received the packet

Name

probe::netdev.change_rx_flag — Called when the device RX flag will be changed

Synopsis

```
netdev.change_rx_flag
```

Values

dev_name	The device that will be changed
flags	The new flags

Name

probe::netdev.set_promiscuity — Called when the device enters/leaves promiscuity

Synopsis

```
netdev.set_promiscuity
```

Values

dev_name	The device that is entering/leaving promiscuity mode
enable	If the device is entering promiscuity mode
inc	Count the number of promiscuity openers
disable	If the device is leaving promiscuity mode

Name

probe::netdev.ioctl — Called when the device suffers an IOCTL

Synopsis

```
netdev.ioctl
```

Values

cmd The IOCTL request

arg The IOCTL argument (usually the netdev interface)

Name

probe::netdev.register — Called when the device is registered

Synopsis

```
netdev.register
```

Values

dev_name	The device that is going to be registered

Name

probe::netdev.unregister — Called when the device is being unregistered

Synopsis

```
netdev.unregister
```

Values

dev_name	The device that is going to be unregistered

Name

probe::netdev.get_stats — Called when someone asks the device statistics

Synopsis

```
netdev.get_stats
```

Values

dev_name	The device that is going to provide the statistics

Name

probe::netdev.change_mac — Called when the netdev_name has the MAC changed

Synopsis

```
netdev.change_mac
```

Values

dev_name	The device that will have the MTU changed
new_mac	The new MAC address
mac_len	The MAC length
old_mac	The current MAC address

Name

probe::tcp.sendmsg — Sending a tcp message

Synopsis

```
tcp.sendmsg
```

Values

name	Name of this probe
size	Number of bytes to send
sock	Network socket

Context

The process which sends a tcp message

Name

probe::tcp.sendmsg.return — Sending TCP message is done

Synopsis

```
tcp.sendmsg.return
```

Values

name Name of this probe

size Number of bytes sent or error code if an error occurred.

Context

The process which sends a tcp message

Name

probe::tcp.recvmsg — Receiving TCP message

Synopsis

```
tcp.recvmsg
```

Values

saddr	A string representing the source IP address
daddr	A string representing the destination IP address
name	Name of this probe
sport	TCP source port
dport	TCP destination port
size	Number of bytes to be received
sock	Network socket

Context

The process which receives a tcp message

Name

probe::tcp.recvmsg.return — Receiving TCP message complete

Synopsis

```
tcp.recvmsg.return
```

Values

saddr	A string representing the source IP address
daddr	A string representing the destination IP address
name	Name of this probe
sport	TCP source port
dport	TCP destination port
size	Number of bytes received or error code if an error occurred.

Context

The process which receives a tcp message

Name

probe::tcp.disconnect — TCP socket disconnection

Synopsis

```
tcp.disconnect
```

Values

saddr	A string representing the source IP address
daddr	A string representing the destination IP address
flags	TCP flags (e.g. FIN, etc)
name	Name of this probe
sport	TCP source port
dport	TCP destination port
sock	Network socket

Context

The process which disconnects tcp

Name

probe::tcp.disconnect.return — TCP socket disconnection complete

Synopsis

```
tcp.disconnect.return
```

Values

ret	Error code (0: no error)
name	Name of this probe

Context

The process which disconnects tcp

Name

probe::tcp.setsockopt — Call to `setsockopt`

Synopsis

```
tcp.setsockopt
```

Values

optstr	Resolves optname to a human-readable format
level	The level at which the socket options will be manipulated
optlen	Used to access values for `setsockopt`
name	Name of this probe
optname	TCP socket options (e.g. TCP_NODELAY, TCP_MAXSEG, etc)
sock	Network socket

Context

The process which calls setsockopt

Name

probe::tcp.setsockopt.return — Return from `setsockopt`

Synopsis

```
tcp.setsockopt.return
```

Values

ret	Error code (0: no error)
name	Name of this probe

Context

The process which calls setsockopt

Name

probe::tcp.receive — Called when a TCP packet is received

Synopsis

```
tcp.receive
```

Values

urg	TCP URG flag
protocol	Packet protocol from driver
psh	TCP PSH flag
name	Name of the probe point
rst	TCP RST flag
dport	TCP destination port
saddr	A string representing the source IP address
daddr	A string representing the destination IP address
ack	TCP ACK flag
fin	TCP FIN flag
syn	TCP SYN flag
sport	TCP source port
iphdr	IP header address

Name

probe::udp.sendmsg — Fires whenever a process sends a UDP message

Synopsis

```
udp.sendmsg
```

Values

name	The name of this probe
size	Number of bytes sent by the process
sock	Network socket used by the process

Context

The process which sent a UDP message

Name

probe::udp.sendmsg.return — Fires whenever an attempt to send a UDP message is completed

Synopsis

```
udp.sendmsg.return
```

Values

name The name of this probe

size Number of bytes sent by the process

Context

The process which sent a UDP message

Name

probe::udp.recvmsg — Fires whenever a UDP message is received

Synopsis

```
udp.recvmsg
```

Values

name	The name of this probe
size	Number of bytes received by the process
sock	Network socket used by the process

Context

The process which received a UDP message

Name

probe::udp.recvmsg.return — Fires whenever an attempt to receive a UDP message received is completed

Synopsis

```
udp.recvmsg.return
```

Values

name The name of this probe

size Number of bytes received by the process

Context

The process which received a UDP message

Name

probe::udp.disconnect — Fires when a process requests for a UDP disconnection

Synopsis

```
udp.disconnect
```

Values

flags	Flags (e.g. FIN, etc)
name	The name of this probe
sock	Network socket used by the process

Context

The process which requests a UDP disconnection

Name

probe::udp.disconnect.return — UDP has been disconnected successfully

Synopsis

```
udp.disconnect.return
```

Values

ret	Error code (0: no error)
name	The name of this probe

Context

The process which requested a UDP disconnection

Name

function::ip_ntop — returns a string representation from an integer IP number

Synopsis

```
ip_ntop:string(addr:long)
```

Arguments

addr the ip represented as an integer

Chapter 13. Socket Tapset

This family of probe points is used to probe socket activities. It contains the following probe points:

Name

probe::socket.send — Message sent on a socket.

Synopsis

```
socket.send
```

Values

success	Was send successful? (1 = yes, 0 = no)
protocol	Protocol value
flags	Socket flags value
name	Name of this probe
state	Socket state value
size	Size of message sent (in bytes) or error code if success = 0
type	Socket type value
family	Protocol family value

Context

The message sender

Name

probe::socket.receive — Message received on a socket.

Synopsis

```
socket.receive
```

Values

success	Was send successful? (1 = yes, 0 = no)
protocol	Protocol value
flags	Socket flags value
name	Name of this probe
state	Socket state value
size	Size of message received (in bytes) or error code if success = 0
type	Socket type value
family	Protocol family value

Context

The message receiver

Name

probe::socket.sendmsg — Message is currently being sent on a socket.

Synopsis

```
socket.sendmsg
```

Values

protocol	Protocol value
flags	Socket flags value
name	Name of this probe
state	Socket state value
size	Message size in bytes
type	Socket type value
family	Protocol family value

Context

The message sender

Description

Fires at the beginning of sending a message on a socket via the `sock_sendmsg` function

Name

probe::socket.sendmsg.return — Return from socket.sendmsg.

Synopsis

```
socket.sendmsg.return
```

Values

success	Was send successful? (1 = yes, 0 = no)
protocol	Protocol value
flags	Socket flags value
name	Name of this probe
state	Socket state value
size	Size of message sent (in bytes) or error code if success = 0
type	Socket type value
family	Protocol family value

Context

The message sender.

Description

Fires at the conclusion of sending a message on a socket via the `sock_sendmsg` function

Name

probe::socket.recvmsg — Message being received on socket

Synopsis

```
socket.recvmsg
```

Values

protocol	Protocol value
flags	Socket flags value
name	Name of this probe
state	Socket state value
size	Message size in bytes
type	Socket type value
family	Protocol family value

Context

The message receiver.

Description

Fires at the beginning of receiving a message on a socket via the `sock_recvmsg` function

Name

probe::socket.recvmsg.return — Return from Message being received on socket

Synopsis

```
socket.recvmsg.return
```

Values

success	Was receive successful? (1 = yes, 0 = no)
protocol	Protocol value
flags	Socket flags value
name	Name of this probe
state	Socket state value
size	Size of message received (in bytes) or error code if success = 0
type	Socket type value
family	Protocol family value

Context

The message receiver.

Description

Fires at the conclusion of receiving a message on a socket via the `sock_recvmsg` function.

Name

probe::socket.aio_write — Message send via `sock_aio_write`

Synopsis

```
socket.aio_write
```

Values

protocol	Protocol value
flags	Socket flags value
name	Name of this probe
state	Socket state value
size	Message size in bytes
type	Socket type value
family	Protocol family value

Context

The message sender

Description

Fires at the beginning of sending a message on a socket via the `sock_aio_write` function

Name

probe::socket.aio_write.return — Conclusion of message send via `sock_aio_write`

Synopsis

```
socket.aio_write.return
```

Values

success	Was receive successful? (1 = yes, 0 = no)
protocol	Protocol value
flags	Socket flags value
name	Name of this probe
state	Socket state value
size	Size of message received (in bytes) or error code if success = 0
type	Socket type value
family	Protocol family value

Context

The message receiver.

Description

Fires at the conclusion of sending a message on a socket via the `sock_aio_write` function

Name

probe::socket.aio_read — Receiving message via `sock_aio_read`

Synopsis

```
socket.aio_read
```

Values

protocol	Protocol value
flags	Socket flags value
name	Name of this probe
state	Socket state value
size	Message size in bytes
type	Socket type value
family	Protocol family value

Context

The message sender

Description

Fires at the beginning of receiving a message on a socket via the `sock_aio_read` function

Name

probe::socket.aio_read.return — Conclusion of message received via `sock_aio_read`

Synopsis

```
socket.aio_read.return
```

Values

success	Was receive successful? (1 = yes, 0 = no)
protocol	Protocol value
flags	Socket flags value
name	Name of this probe
state	Socket state value
size	Size of message received (in bytes) or error code if success = 0
type	Socket type value
family	Protocol family value

Context

The message receiver.

Description

Fires at the conclusion of receiving a message on a socket via the `sock_aio_read` function

Name

probe::socket.writev — Message sent via `socket_writev`

Synopsis

```
socket.writev
```

Values

protocol	Protocol value
flags	Socket flags value
name	Name of this probe
state	Socket state value
size	Message size in bytes
type	Socket type value
family	Protocol family value

Context

The message sender

Description

Fires at the beginning of sending a message on a socket via the `sock_writev` function

Name

probe::socket.writev.return — Conclusion of message sent via `socket_writev`

Synopsis

```
socket.writev.return
```

Values

success	Was send successful? (1 = yes, 0 = no)
protocol	Protocol value
flags	Socket flags value
name	Name of this probe
state	Socket state value
size	Size of message sent (in bytes) or error code if success = 0
type	Socket type value
family	Protocol family value

Context

The message receiver.

Description

Fires at the conclusion of sending a message on a socket via the `sock_writev` function

Name

probe::socket.readv — Receiving a message via `sock_readv`

Synopsis

```
socket.readv
```

Values

protocol	Protocol value
flags	Socket flags value
name	Name of this probe
state	Socket state value
size	Message size in bytes
type	Socket type value
family	Protocol family value

Context

The message sender

Description

Fires at the beginning of receiving a message on a socket via the `sock_readv` function

Name

probe::socket.readv.return — Conclusion of receiving a message via `sock_readv`

Synopsis

```
socket.readv.return
```

Values

success	Was receive successful? (1 = yes, 0 = no)
protocol	Protocol value
flags	Socket flags value
name	Name of this probe
state	Socket state value
size	Size of message received (in bytes) or error code if success = 0
type	Socket type value
family	Protocol family value

Context

The message receiver.

Description

Fires at the conclusion of receiving a message on a socket via the `sock_readv` function

Name

probe::socket.create — Creation of a socket

Synopsis

```
socket.create
```

Values

protocol	Protocol value
name	Name of this probe
requester	Requested by user process or the kernel (1 = kernel, 0 = user)
type	Socket type value
family	Protocol family value

Context

The requester (see requester variable)

Description

Fires at the beginning of creating a socket.

Name

probe::socket.create.return — Return from Creation of a socket

Synopsis

```
socket.create.return
```

Values

success	Was socket creation successful? (1 = yes, 0 = no)
protocol	Protocol value
err	Error code if success == 0
name	Name of this probe
requester	Requested by user process or the kernel (1 = kernel, 0 = user)
type	Socket type value
family	Protocol family value

Context

The requester (user process or kernel)

Description

Fires at the conclusion of creating a socket.

Name

probe::socket.close — Close a socket

Synopsis

```
socket.close
```

Values

protocol	Protocol value
flags	Socket flags value
name	Name of this probe
state	Socket state value
type	Socket type value
family	Protocol family value

Context

The requester (user process or kernel)

Description

Fires at the beginning of closing a socket.

Name

probe::socket.close.return — Return from closing a socket

Synopsis

```
socket.close.return
```

Values

name Name of this probe

Context

The requester (user process or kernel)

Description

Fires at the conclusion of closing a socket.

Name

function::sock_prot_num2str — Given a protocol number, return a string representation.

Synopsis

```
sock_prot_num2str:string(proto:long)
```

Arguments

proto The protocol number.

Name

function::sock_prot_str2num — Given a protocol name (string), return the corresponding protocol number.

Synopsis

```
sock_prot_str2num:long(proto:string)
```

Arguments

proto The protocol name.

Name

function::sock_fam_num2str — Given a protocol family number, return a string representation.

Synopsis

```
sock_fam_num2str:string(family:long)
```

Arguments

family	The family number.

Name

function::sock_fam_str2num — Given a protocol family name (string), return the corresponding

Synopsis

```
sock_fam_str2num:long(family:string)
```

Arguments

family The family name.

Description

protocol family number.

Name

function::sock_state_num2str — Given a socket state number, return a string representation.

Synopsis

```
sock_state_num2str:string(state:long)
```

Arguments

state	The state number.

Name

function::sock_state_str2num — Given a socket state string, return the corresponding state number.

Synopsis

```
sock_state_str2num:long(state:string)
```

Arguments

state	The state name.

Chapter 14. SNMP Information Tapset

This family of probe points is used to probe socket activities to provide SNMP type information. It contains the following functions and probe points:

Name

function::ipmib_remote_addr — Get the remote ip address

Synopsis

```
ipmib_remote_addr:long(skb:long,SourceIsLocal:long)
```

Arguments

skb	pointer to a struct sk_buff
SourceIsLocal	flag to indicate whether local operation

Description

Returns the remote ip address from *skb*.

Name

function::ipmib_local_addr — Get the local ip address

Synopsis

```
ipmib_local_addr:long(skb:long,SourceIsLocal:long)
```

Arguments

skb	pointer to a struct sk_buff
SourceIsLocal	flag to indicate whether local operation

Description

Returns the local ip address *skb*.

Name

function::ipmib_tcp_remote_port — Get the remote tcp port

Synopsis

```
ipmib_tcp_remote_port:long(skb:long,SourceIsLocal:long)
```

Arguments

skb	pointer to a struct sk_buff
SourceIsLocal	flag to indicate whether local operation

Description

Returns the remote tcp port from *skb*.

Name

function::ipmib_tcp_local_port — Get the local tcp port

Synopsis

```
ipmib_tcp_local_port:long(skb:long,SourceIsLocal:long)
```

Arguments

skb	pointer to a struct sk_buff
SourceIsLocal	flag to indicate whether local operation

Description

Returns the local tcp port from *skb*.

Name

function::ipmib_get_proto — Get the protocol value

Synopsis

```
ipmib_get_proto:long(skb:long)
```

Arguments

skb pointer to a struct sk_buff

Description

Returns the protocol value from *skb*.

Name

probe::ipmib.InReceives — Count an arriving packet

Synopsis

```
ipmib.InReceives
```

Values

skb pointer to the struct sk_buff being acted on

op value to be added to the counter (default value of 1)

Description

The packet pointed to by *skb* is filtered by the function `ipmib_filter_key`. If the packet passes the filter is is counted in the global *InReceives* (equivalent to SNMP's MIB IPSTATS_MIB_INRECEIVES)

Name

probe::ipmib.InNoRoutes — Count an arriving packet with no matching socket

Synopsis

```
ipmib.InNoRoutes
```

Values

skb pointer to the struct sk_buff being acted on

op value to be added to the counter (default value of 1)

Description

The packet pointed to by *skb* is filtered by the function `ipmib_filter_key`. If the packet passes the filter is is counted in the global *InNoRoutes* (equivalent to SNMP's MIB IPSTATS_MIB_INNOROUTES)

Name

probe::ipmib.InAddrErrors — Count arriving packets with an incorrect address

Synopsis

```
ipmib.InAddrErrors
```

Values

skb pointer to the struct sk_buff being acted on

op value to be added to the counter (default value of 1)

Description

The packet pointed to by *skb* is filtered by the function `ipmib_filter_key`. If the packet passes the filter is is counted in the global *InAddrErrors* (equivalent to SNMP's MIB IPSTATS_MIB_INADDRERRORS)

Name

probe::ipmib.InUnknownProtos — Count arriving packets with an unbound proto

Synopsis

```
ipmib.InUnknownProtos
```

Values

skb pointer to the struct sk_buff being acted on

op value to be added to the counter (default value of 1)

Description

The packet pointed to by *skb* is filtered by the function `ipmib_filter_key`. If the packet passes the filter is is counted in the global *InUnknownProtos* (equivalent to SNMP's MIB IPSTATS_MIB_INUNKNOWNPROTOS)

Name

probe::ipmib.InDiscards — Count discarded inbound packets

Synopsis

```
ipmib.InDiscards
```

Values

skb pointer to the struct sk_buff being acted on

op value to be added to the counter (default value of 1)

Description

The packet pointed to by *skb* is filtered by the function `ipmib_filter_key`. If the packet passes the filter is is counted in the global *InDiscards* (equivalent to SNMP's MIB STATS_MIB_INDISCARDS)

Name

probe::ipmib.ForwDatagrams — Count forwarded packet

Synopsis

```
ipmib.ForwDatagrams
```

Values

skb pointer to the struct sk_buff being acted on

op value to be added to the counter (default value of 1)

Description

The packet pointed to by *skb* is filtered by the function `ipmib_filter_key`. If the packet passes the filter is is counted in the global *ForwDatagrams* (equivalent to SNMP's MIB IPSTATS_MIB_OUTFORWDATAGRAMS)

Name

probe::ipmib.OutRequests — Count a request to send a packet

Synopsis

```
ipmib.OutRequests
```

Values

skb pointer to the struct sk_buff being acted on

op value to be added to the counter (default value of 1)

Description

The packet pointed to by *skb* is filtered by the function `ipmib_filter_key`. If the packet passes the filter is is counted in the global *OutRequests* (equivalent to SNMP's MIB IPSTATS_MIB_OUTREQUESTS)

Name

probe::ipmib.ReasmTimeout — Count Reassembly Timeouts

Synopsis

```
ipmib.ReasmTimeout
```

Values

skb pointer to the struct sk_buff being acted on

op value to be added to the counter (default value of 1)

Description

The packet pointed to by *skb* is filtered by the function `ipmib_filter_key`. If the packet passes the filter is is counted in the global *ReasmTimeout* (equivalent to SNMP's MIB IPSTATS_MIB_REASMTIMEOUT)

Name

probe::ipmib.ReasmReqds — Count number of packet fragments reassembly requests

Synopsis

```
ipmib.ReasmReqds
```

Values

skb pointer to the struct sk_buff being acted on

op value to be added to the counter (default value of 1)

Description

The packet pointed to by *skb* is filtered by the function `ipmib_filter_key`. If the packet passes the filter is is counted in the global *ReasmReqds* (equivalent to SNMP's MIB IPSTATS_MIB_REASMREQDS)

Name

probe::ipmib.FragOKs — Count datagram fragmented successfully

Synopsis

```
ipmib.FragOKs
```

Values

skb pointer to the struct sk_buff being acted on

op value to be added to the counter (default value of 1)

Description

The packet pointed to by *skb* is filtered by the function `ipmib_filter_key`. If the packet passes the filter is is counted in the global *FragOKs* (equivalent to SNMP's MIB IPSTATS_MIB_FRAGOKS)

Name

probe::ipmib.FragFails — Count datagram fragmented unsuccessfully

Synopsis

```
ipmib.FragFails
```

Values

skb pointer to the struct sk_buff being acted on

op Value to be added to the counter (default value of 1)

Description

The packet pointed to by *skb* is filtered by the function `ipmib_filter_key`. If the packet passes the filter is is counted in the global *FragFails* (equivalent to SNMP's MIB IPSTATS_MIB_FRAGFAILS)

Name

function::tcpmib_get_state — Get a socket's state

Synopsis

```
tcpmib_get_state:long(sk:long)
```

Arguments

sk pointer to a struct sock

Description

Returns the sk_state from a struct sock.

Name

function::tcpmib_local_addr — Get the source address

Synopsis

```
tcpmib_local_addr:long(sk:long)
```

Arguments

sk pointer to a struct inet_sock

Description

Returns the saddr from a struct inet_sock in host order.

Name

function::tcpmib_remote_addr — Get the remote address

Synopsis

```
tcpmib_remote_addr:long(sk:long)
```

Arguments

sk pointer to a struct inet_sock

Description

Returns the daddr from a struct inet_sock in host order.

Name

function::tcpmib_local_port — Get the local port

Synopsis

```
tcpmib_local_port:long(sk:long)
```

Arguments

sk pointer to a struct inet_sock

Description

Returns the sport from a struct inet_sock in host order.

Name

function::tcpmib_remote_port — Get the remote port

Synopsis

```
tcpmib_remote_port:long(sk:long)
```

Arguments

sk pointer to a struct inet_sock

Description

Returns the dport from a struct inet_sock in host order.

Name

probe::tcpmib.ActiveOpens — Count an active opening of a socket

Synopsis

```
tcpmib.ActiveOpens
```

Values

sk pointer to the struct sock being acted on

op value to be added to the counter (default value of 1)

Description

The packet pointed to by *skb* is filtered by the function `tcpmib_filter_key`. If the packet passes the filter is is counted in the global *ActiveOpens* (equivalent to SNMP's MIB TCP_MIB_ACTIVEOPENS)

Name

probe::tcpmib.AttemptFails — Count a failed attempt to open a socket

Synopsis

```
tcpmib.AttemptFails
```

Values

sk pointer to the struct sock being acted on

op value to be added to the counter (default value of 1)

Description

The packet pointed to by *skb* is filtered by the function `tcpmib_filter_key`. If the packet passes the filter is is counted in the global *AttemptFails* (equivalent to SNMP's MIB TCP_MIB_ATTEMPTFAILS)

Name

probe::tcpmib.CurrEstab — Update the count of open sockets

Synopsis

```
tcpmib.CurrEstab
```

Values

sk pointer to the struct sock being acted on

op value to be added to the counter (default value of 1)

Description

The packet pointed to by *skb* is filtered by the function `tcpmib_filter_key`. If the packet passes the filter is is counted in the global *CurrEstab* (equivalent to SNMP's MIB TCP_MIB_CURRESTAB)

Name

probe::tcpmib.EstabResets — Count the reset of a socket

Synopsis

```
tcpmib.EstabResets
```

Values

sk pointer to the struct sock being acted on

op value to be added to the counter (default value of 1)

Description

The packet pointed to by *skb* is filtered by the function `tcpmib_filter_key`. If the packet passes the filter is is counted in the global *EstabResets* (equivalent to SNMP's MIB TCP_MIB_ESTABRESETS)

Name

probe::tcpmib.InSegs — Count an incomming tcp segment

Synopsis

```
tcpmib.InSegs
```

Values

sk pointer to the struct sock being acted on

op value to be added to the counter (default value of 1)

Description

The packet pointed to by *skb* is filtered by the function `tcpmib_filter_key` (or `ipmib_filter_key` for tcp v4). If the packet passes the filter is is counted in the global *InSegs* (equivalent to SNMP's MIB TCP_MIB_INSEGS)

Name

probe::tcpmib.OutRsts — Count the sending of a reset packet

Synopsis

```
tcpmib.OutRsts
```

Values

sk pointer to the struct sock being acted on

op value to be added to the counter (default value of 1)

Description

The packet pointed to by *skb* is filtered by the function `tcpmib_filter_key`. If the packet passes the filter is is counted in the global *OutRsts* (equivalent to SNMP's MIB TCP_MIB_OUTRSTS)

Name

probe::tcpmib.OutSegs — Count the sending of a TCP segment

Synopsis

```
tcpmib.OutSegs
```

Values

sk pointer to the struct sock being acted on

op value to be added to the counter (default value of 1)

Description

The packet pointed to by *skb* is filtered by the function `tcpmib_filter_key`. If the packet passes the filter is is counted in the global *OutSegs* (equivalent to SNMP's MIB TCP_MIB_OUTSEGS)

Name

probe::tcpmib.PassiveOpens — Count the passive creation of a socket

Synopsis

```
tcpmib.PassiveOpens
```

Values

sk pointer to the struct sock being acted on

op value to be added to the counter (default value of 1)

Description

The packet pointed to by *skb* is filtered by the function `tcpmib_filter_key`. If the packet passes the filter is is counted in the global *PassiveOpens* (equivalent to SNMP's MIB TCP_MIB_PASSIVEOPENS)

Name

probe::tcpmib.RetransSegs — Count the retransmission of a TCP segment

Synopsis

```
tcpmib.RetransSegs
```

Values

sk pointer to the struct sock being acted on

op value to be added to the counter (default value of 1)

Description

The packet pointed to by *skb* is filtered by the function `tcpmib_filter_key`. If the packet passes the filter is is counted in the global *RetransSegs* (equivalent to SNMP's MIB TCP_MIB_RETRANSSEGS)

Name

probe::linuxmib.DelayedACKs — Count of delayed acks

Synopsis

```
linuxmib.DelayedACKs
```

Values

sk Pointer to the struct sock being acted on

op Value to be added to the counter (default value of 1)

Description

The packet pointed to by *skb* is filtered by the function `linuxmib_filter_key`. If the packet passes the filter is is counted in the global *DelayedACKs* (equivalent to SNMP's MIB LINUX_MIB_DELAYEDACKS)

Name

probe::linuxmib.ListenOverflows — Count of times a listen queue overflowed

Synopsis

```
linuxmib.ListenOverflows
```

Values

sk Pointer to the struct sock being acted on

op Value to be added to the counter (default value of 1)

Description

The packet pointed to by *skb* is filtered by the function `linuxmib_filter_key`. If the packet passes the filter is is counted in the global *ListenOverflows* (equivalent to SNMP's MIB LINUX_MIB_LISTENOVERFLOWS)

Name

probe::linuxmib.ListenDrops — Count of times conn request that were dropped

Synopsis

```
linuxmib.ListenDrops
```

Values

sk Pointer to the struct sock being acted on

op Value to be added to the counter (default value of 1)

Description

The packet pointed to by *skb* is filtered by the function `linuxmib_filter_key`. If the packet passes the filter is is counted in the global *ListenDrops* (equivalent to SNMP's MIB LINUX_MIB_LISTENDROPS)

Name

probe::linuxmib.TCPMemoryPressures — Count of times memory pressure was used

Synopsis

```
linuxmib.TCPMemoryPressures
```

Values

sk Pointer to the struct sock being acted on

op Value to be added to the counter (default value of 1)

Description

The packet pointed to by *skb* is filtered by the function `linuxmib_filter_key`. If the packet passes the filter is is counted in the global *TCPMemoryPressures* (equivalent to SNMP's MIB LINUX_MIB_TCPMEMORYPRESSURES)

Chapter 15. Kernel Process Tapset

This family of probe points is used to probe process-related activities. It contains the following probe points:

Name

probe::kprocess.create — Fires whenever a new process is successfully created

Synopsis

```
kprocess.create
```

Values

new_pid The PID of the newly created process

Context

Parent of the created process.

Description

Fires whenever a new process is successfully created, either as a result of fork (or one of its syscall variants), or a new kernel thread.

Name

probe::kprocess.start — Starting new process

Synopsis

```
kprocess.start
```

Values

None

Context

Newly created process.

Description

Fires immediately before a new process begins execution.

Name

probe::kprocess.exec — Attempt to exec to a new program

Synopsis

```
kprocess.exec
```

Values

filename The path to the new executable

Context

The caller of exec.

Description

Fires whenever a process attempts to exec to a new program.

Name

probe::kprocess.exec_complete — Return from exec to a new program

Synopsis

```
kprocess.exec_complete
```

Values

success	A boolean indicating whether the exec was successful
errno	The error number resulting from the exec

Context

On success, the context of the new executable. On failure, remains in the context of the caller.

Description

Fires at the completion of an exec call.

Name

probe::kprocess.exit — Exit from process

Synopsis

```
kprocess.exit
```

Values

code The exit code of the process

Context

The process which is terminating.

Description

Fires when a process terminates. This will always be followed by a kprocess.release, though the latter may be delayed if the process waits in a zombie state.

Name

probe::kprocess.release — Process released

Synopsis

```
kprocess.release
```

Values

pid PID of the process being released

task A task handle to the process being released

Context

The context of the parent, if it wanted notification of this process' termination, else the context of the process itself.

Description

Fires when a process is released from the kernel. This always follows a kprocess.exit, though it may be delayed somewhat if the process waits in a zombie state.

Chapter 16. Signal Tapset

This family of probe points is used to probe signal activities. It contains the following probe points:

Name

probe::signal.send — Signal being sent to a process

Synopsis

```
signal.send
```

Values

send2queue	Indicates whether the signal is sent to an existing sigqueue
name	The name of the function used to send out the signal
task	A task handle to the signal recipient
sinfo	The address of siginfo struct
si_code	Indicates the signal type
sig_name	A string representation of the signal
sig	The number of the signal
shared	Indicates whether the signal is shared by the thread group
sig_pid	The PID of the process receiving the signal
pid_name	The name of the signal recipient

Context

The signal's sender.

Name

probe::signal.send.return — Signal being sent to a process completed

Synopsis

```
signal.send.return
```

Values

retstr	The return value to either __group_send_sig_info, specific_send_sig_info, or send_sigqueue
send2queue	Indicates whether the sent signal was sent to an existing sigqueue
name	The name of the function used to send out the signal
shared	Indicates whether the sent signal is shared by the thread group.

Context

The signal's sender. (correct?)

Description

Possible __group_send_sig_info and specific_send_sig_info return values are as follows;

0 -- The signal is sucessfully sent to a process,

which means that

(1) the signal was ignored by the receiving process, (2) this is a non-RT signal and the system already has one queued, and (3) the signal was successfully added to the sigqueue of the receiving process.

-EAGAIN -- The sigqueue of the receiving process is overflowing, the signal was RT, and the signal was sent by a user using something other than `kill`.

Possible send_group_sigqueue and send_sigqueue return values are as follows;

0 -- The signal was either sucessfully added into the sigqueue of the receiving process, or a SI_TIMER entry is already queued (in which case, the overrun count will be simply incremented).

1 -- The signal was ignored by the receiving process.

-1 -- (send_sigqueue only) The task was marked exiting, allowing * posix_timer_event to redirect it to the group leader.

Name

probe::signal.checkperm — Check being performed on a sent signal

Synopsis

```
signal.checkperm
```

Values

name	Name of the probe point
task	A task handle to the signal recipient
sinfo	The address of the siginfo structure
si_code	Indicates the signal type
sig_name	A string representation of the signal
sig	The number of the signal
pid_name	Name of the process receiving the signal
sig_pid	The PID of the process receiving the signal

Name

probe::signal.checkperm.return — Check performed on a sent signal completed

Synopsis

```
signal.checkperm.return
```

Values

retstr	Return value as a string
name	Name of the probe point

Name

probe::signal.wakeup — Sleeping process being wakened for signal

Synopsis

```
signal.wakeup
```

Values

resume	Indicates whether to wake up a task in a STOPPED or TRACED state
state_mask	A string representation indicating the mask of task states to wake. Possible values are TASK_INTERRUPTIBLE, TASK_STOPPED, TASK_TRACED, and TASK_INTERRUPTIBLE.
pid_name	Name of the process to wake
sig_pid	The PID of the process to wake

Name

probe::signal.check_ignored — Checking to see signal is ignored

Synopsis

```
signal.check_ignored
```

Values

sig_name	A string representation of the signal
sig	The number of the signal
pid_name	Name of the process receiving the signal
sig_pid	The PID of the process receiving the signal

Name

probe::signal.check_ignored.return — Check to see signal is ignored completed

Synopsis

```
signal.check_ignored.return
```

Values

retstr	Return value as a string
name	Name of the probe point

Name

probe::signal.force_segv — Forcing send of SIGSEGV

Synopsis

```
signal.force_segv
```

Values

name	Name of the probe point
sig_name	A string representation of the signal
sig	The number of the signal
pid_name	Name of the process receiving the signal
sig_pid	The PID of the process receiving the signal

Name

probe::signal.force_segv.return — Forcing send of SIGSEGV complete

Synopsis

```
signal.force_segv.return
```

Values

retstr	Return value as a string
name	Name of the probe point

Name

probe::signal.syskill — Sending kill signal to a process

Synopsis

```
signal.syskill
```

Values

name	Name of the probe point
sig_name	A string representation of the signal
sig	The specific signal sent to the process
pid_name	The name of the signal recipient
sig_pid	The PID of the process receiving the signal

Name

probe::signal.syskill.return — Sending kill signal completed

Synopsis

```
signal.syskill.return
```

Values

None

Name

probe::signal.sys_tkill — Sending a kill signal to a thread

Synopsis

```
signal.sys_tkill
```

Values

name	Name of the probe point
sig_name	A string representation of the signal
sig	The specific signal sent to the process
pid_name	The name of the signal recipient
sig_pid	The PID of the process receiving the kill signal

Description

The tkill call is analogous to kill(2), except that it also allows a process within a specific thread group to be targeted. Such processes are targeted through their unique thread IDs (TID).

Name

probe::signal.systkill.return — Sending kill signal to a thread completed

Synopsis

```
signal.systkill.return
```

Values

retstr	The return value to either __group_send_sig_info,
name	Name of the probe point

Name

probe::signal.sys_tgkill — Sending kill signal to a thread group

Synopsis

```
signal.sys_tgkill
```

Values

name	Name of the probe point
sig_name	A string representation of the signal
sig	The specific kill signal sent to the process
tgid	The thread group ID of the thread receiving the kill signal
pid_name	The name of the signal recipient
sig_pid	The PID of the thread receiving the kill signal

Description

The tgkill call is similar to tkill, except that it also allows the caller to specify the thread group ID of the thread to be signalled. This protects against TID reuse.

Name

probe::signal.sys_tgkill.return — Sending kill signal to a thread group completed

Synopsis

```
signal.sys_tgkill.return
```

Values

retstr	The return value to either __group_send_sig_info,
name	Name of the probe point

Name

probe::signal.send_sig_queue — Queuing a signal to a process

Synopsis

```
signal.send_sig_queue
```

Values

sigqueue_addr	The address of the signal queue
name	Name of the probe point
sig_name	A string representation of the signal
sig	The queued signal
pid_name	Name of the process to which the signal is queued
sig_pid	The PID of the process to which the signal is queued

Name

probe::signal.send_sig_queue.return — Queuing a signal to a process completed

Synopsis

```
signal.send_sig_queue.return
```

Values

retstr	Return value as a string
name	Name of the probe point

Name

probe::signal.pending — Examining pending signal

Synopsis

```
signal.pending
```

Values

name	Name of the probe point
sigset_size	The size of the user-space signal set
sigset_add	The address of the user-space signal set (sigset_t)

Description

This probe is used to examine a set of signals pending for delivery to a specific thread. This normally occurs when the do_sigpending kernel function is executed.

Name

probe::signal.pending.return — Examination of pending signal completed

Synopsis

```
signal.pending.return
```

Values

retstr	Return value as a string
name	Name of the probe point

Name

probe::signal.handle — Signal handler being invoked

Synopsis

```
signal.handle
```

Values

regs	The address of the kernel-mode stack area
sig_code	The si_code value of the siginfo signal
name	Name of the probe point
sig_mode	Indicates whether the signal was a user-mode or kernel-mode signal
sinfo	The address of the siginfo table
sig_name	A string representation of the signal
oldset_addr	The address of the bitmask array of blocked signals
sig	The signal number that invoked the signal handler
ka_addr	The address of the k_sigaction table associated with the signal

Name

probe::signal.handle.return — Signal handler invocation completed

Synopsis

```
signal.handle.return
```

Values

retstr	Return value as a string
name	Name of the probe point

Name

probe::signal.do_action — Examining or changing a signal action

Synopsis

```
signal.do_action
```

Values

sa_mask	The new mask of the signal
name	Name of the probe point
sig_name	A string representation of the signal
oldsigact_addr	The address of the old sigaction struct associated with the signal
sig	The signal to be examined/changed
sa_handler	The new handler of the signal
sigact_addr	The address of the new sigaction struct associated with the signal

Name

probe::signal.do_action.return — Examining or changing a signal action completed

Synopsis

```
signal.do_action.return
```

Values

retstr	Return value as a string
name	Name of the probe point

Name

probe::signal.procmask — Examining or changing blocked signals

Synopsis

```
signal.procmask
```

Values

how	Indicates how to change the blocked signals; possible values are SIG_BLOCK=0 (for blocking signals), SIG_UNBLOCK=1 (for unblocking signals), and SIG_SETMASK=2 for setting the signal mask.
name	Name of the probe point
oldsigset_addr	The old address of the signal set (sigset_t)
sigset	The actual value to be set for sigset_t (correct?)
sigset_addr	The address of the signal set (sigset_t) to be implemented

Name

probe::signal.procmask.return — Examining or changing blocked signals completed

Synopsis

```
signal.procmask.return
```

Values

retstr	Return value as a string
name	Name of the probe point

Name

probe::signal.flush — Flushing all pending signals for a task

Synopsis

```
signal.flush
```

Values

name	Name of the probe point
task	The task handler of the process performing the flush
pid_name	The name of the process associated with the task performing the flush
sig_pid	The PID of the process associated with the task performing the flush

Chapter 17. Errno Tapset

This set of funciont is used to handle errno number values. It contains the following function:

Name

function::errno_str — Symbolic string associated with error code

Synopsis

```
errno_str:string(err:long)
```

Arguments

err The error number recieved

Description

This function returns the symbolic string associated with the giver error code, such as ENOENT for the number 2, or E#3333 for an out-of-range value such as 3333.

Name

function::returnstr — Formats the return value as a string

Synopsis

```
returnstr:string(format:long)
```

Arguments

format	Variable to determine return type base value

Description

This function is used by the nd_syscall tapset, and returns a string. Set format equal to 1 for a decimal, 2 for hex, 3 for octal.

Note that this function should only be used in dwarfless probes (i.e. 'kprobe.function("foo")'). Other probes should use `return_str`.

Name

function::return_str — Formats the return value as a string

Synopsis

```
return_str:string(format:long,ret:long)
```

Arguments

format	Variable to determine return type base value
ret	Return value (typically `$return`)

Description

This function is used by the syscall tapset, and returns a string. Set format equal to 1 for a decimal, 2 for hex, 3 for octal.

Note that this function is preferred over `returnstr`.

Chapter 18. Directory-entry (dentry) Tapset

This family of functions is used to map kernel VFS directory entry pointers to file or full path names.

Name

function::d_name — get the dirent name

Synopsis

```
d_name:string(dentry:long)
```

Arguments

dentry Pointer to dentry.

Description

Returns the dirent name (path basename).

Name

function::inode_name — get the inode name

Synopsis

```
inode_name:string(inode:long)
```

Arguments

inode Pointer to inode.

Description

Returns the first path basename associated with the given inode.

Name

function::reverse_path_walk — get the full dirent path

Synopsis

```
reverse_path_walk:string(dentry:long)
```

Arguments

dentry Pointer to dentry.

Description

Returns the path name (partial path to mount point).

Name

function::task_dentry_path — get the full dentry path

Synopsis

```
task_dentry_path:string(task:long,dentry:long,vfsmnt:long)
```

Arguments

task	task_struct pointer.
dentry	direntry pointer.
vfsmnt	vfsmnt pointer.

Description

Returns the full dirent name (full path to the root), like the kernel d_path function.

Name

function::d_path — get the full nameidata path

Synopsis

```
d_path:string(nd:long)
```

Arguments

nd Pointer to nameidata.

Description

Returns the full dirent name (full path to the root), like the kernel d_path function.

Chapter 19. Logging Tapset

This family of functions is used to send simple message strings to various destinations.

Name

function::log — Send a line to the common trace buffer

Synopsis

```
log(msg:string)
```

Arguments

msg The formatted message string

Description

This function logs data. log sends the message immediately to staprun and to the bulk transport (relayfs) if it is being used. If the last character given is not a newline, then one is added. This function is not as effecient as printf and should be used only for urgent messages.

Name

function::warn — Send a line to the warning stream

Synopsis

```
warn(msg:string)
```

Arguments

msg The formatted message string

Description

This function sends a warning message immediately to staprun. It is also sent over the bulk transport (relayfs) if it is being used. If the last characater is not a newline, the one is added.

Name

function::exit — Start shutting down probing script.

Synopsis

```
exit()
```

Arguments

None

Description

This only enqueues a request to start shutting down the script. New probes will not fire (except “end” probes), but all currently running ones may complete their work.

Name

function::error — Send an error message

Synopsis

```
error(msg:string)
```

Arguments

msg The formatted message string

Description

An implicit end-of-line is added. staprun prepends the string "ERROR:". Sending an error message aborts the currently running probe. Depending on the MAXERRORS parameter, it may trigger an `exit`.

Name

function::ftrace — Send a message to the ftrace ring-buffer

Synopsis

```
ftrace(msg:string)
```

Arguments

msg The formatted message string

Description

If the ftrace ring-buffer is configured & available, see /debugfs/tracing/trace for the message. Otherwise, the message may be quietly dropped. An implicit end-of-line is added.

Chapter 20. Queue Statistics Tapset

This family of functions is used to track performance of queuing systems.

Name

function::qs_wait — Function to record enqueue requests

Synopsis

```
qs_wait(qname:string)
```

Arguments

qname	the name of the queue requesting enqueue

Description

This function records that a new request was enqueued for the given queue name.

Name

function::qs_run — Function to record being moved from wait queue to being serviced

Synopsis

```
qs_run(qname:string)
```

Arguments

qname	the name of the service being moved and started

Description

This function records that the previous enqueued request was removed from the given wait queue and is now being serviced.

Name

function::qs_done — Function to record finishing request

Synopsis

```
qs_done(qname:string)
```

Arguments

qname	the name of the service that finished

Description

This function records that a request originally from the given queue has completed being serviced.

Name

function::qsq_start — Function to reset the stats for a queue

Synopsis

```
qsq_start(qname:string)
```

Arguments

qname	the name of the service that finished

Description

This function resets the statistics counters for the given queue, and restarts tracking from the moment the function was called. This function is also used to create intialize a queue.

Name

function::qsq_utilization — Fraction of time that any request was being serviced

Synopsis

```
qsq_utilization:long(qname:string,scale:long)
```

Arguments

qname	queue name
scale	scale variable to take account for interval fraction

Description

This function returns the average time in microseconds that at least one request was being serviced.

Name

function::qsq_blocked — Returns the time reqest was on the wait queue

Synopsis

```
qsq_blocked:long(qname:string,scale:long)
```

Arguments

qname	queue name
scale	scale variable to take account for interval fraction

Description

This function returns the fraction of elapsed time during which one or more requests were on the wait queue.

Name

function::qsq_wait_queue_length — length of wait queue

Synopsis

```
qsq_wait_queue_length:long(qname:string,scale:long)
```

Arguments

qname	queue name
scale	scale variable to take account for interval fraction

Description

This function returns the average length of the wait queue

Name

function::qsq_service_time — Amount of time per request service

Synopsis

```
qsq_service_time:long(qname:string,scale:long)
```

Arguments

qname	queue name
scale	scale variable to take account for interval fraction

Description

This function returns the average time in microseconds required to service a request once it is removed from the wait queue.

Name

function::qsq_wait_time — Amount of time in queue + service per request

Synopsis

```
qsq_wait_time:long(qname:string,scale:long)
```

Arguments

qname	queue name
scale	scale variable to take account for interval fraction

Description

This function returns the average time in microseconds that it took for a request to be serviced (`qs_wait` to `qa_done`).

Name

function::qsq_throughput — Number of requests served per unit time

Synopsis

```
qsq_throughput:long(qname:string,scale:long)
```

Arguments

qname	queue name
scale	scale variable to take account for interval fraction

Description

This function returns the average number or requests served per microsecond.

Name

function::qsq_print — Returns a line of statistics for the given queue

Synopsis

```
qsq_print(qname:string)
```

Arguments

qname queue name

Description

This function prints a line containing the following

statistics for the given queue

the queue name, the average rate of requests per second, the average wait queue length, the average time on the wait queue, the average time to service a request, the percentage of time the wait queue was used, and the percentage of time request was being serviced.

Chapter 21. Random functions Tapset

These functions deal with random number generation.

Name

function::randint — Return a random number between [0,n)

Synopsis

```
randint:long(n:long)
```

Arguments

n Number past upper limit of range, not larger than 2**20.

Chapter 22. String and data retrieving functions Tapset

Functions to retrieve strings and other primitive types from the kernel or a user space programs based on addresses. All strings are of a maximum length given by MAXSTRINGLEN.

Name

function::kernel_string — Retrieves string from kernel memory

Synopsis

```
kernel_string:string(addr:long)
```

Arguments

addr The kernel address to retrieve the string from

Description

This function returns the null terminated C string from a given kernel memory address. Reports an error on string copy fault.

Name

function::kernel_string2 — Retrieves string from kernel memory with alternative error string

Synopsis

```
kernel_string2:string(addr:long,err_msg:string)
```

Arguments

addr	The kernel address to retrieve the string from
err_msg	The error message to return when data isn't available

Description

This function returns the null terminated C string from a given kernel memory address. Reports the given error message on string copy fault.

Name

function::kernel_string_n — Retrieves string of given length from kernel memory

Synopsis

```
kernel_string_n:string(addr:long,n:long)
```

Arguments

addr	The kernel address to retrieve the string from
n	The maximum length of the string (if not null terminated)

Description

Returns the C string of a maximum given length from a given kernel memory address. Reports an error on string copy fault.

Name

function::kernel_long — Retrieves a long value stored in kernel memory

Synopsis

```
kernel_long:long(addr:long)
```

Arguments

addr The kernel address to retrieve the long from

Description

Returns the long value from a given kernel memory address. Reports an error when reading from the given address fails.

Name

function::kernel_int — Retrieves an int value stored in kernel memory

Synopsis

```
kernel_int:long(addr:long)
```

Arguments

addr The kernel address to retrieve the int from

Description

Returns the int value from a given kernel memory address. Reports an error when reading from the given address fails.

Name

function::kernel_short — Retrieves a short value stored in kernel memory

Synopsis

```
kernel_short:long(addr:long)
```

Arguments

addr The kernel address to retrieve the short from

Description

Returns the short value from a given kernel memory address. Reports an error when reading from the given address fails.

Name

function::kernel_char — Retrieves a char value stored in kernel memory

Synopsis

```
kernel_char:long(addr:long)
```

Arguments

addr The kernel address to retrieve the char from

Description

Returns the char value from a given kernel memory address. Reports an error when reading from the given address fails.

Name

function::kernel_pointer — Retrieves a pointer value stored in kernel memory

Synopsis

```
kernel_pointer:long(addr:long)
```

Arguments

addr The kernel address to retrieve the pointer from

Description

Returns the pointer value from a given kernel memory address. Reports an error when reading from the given address fails.

Name

function::user_string — Retrieves string from user space

Synopsis

```
user_string:string(addr:long)
```

Arguments

addr the user space address to retrieve the string from

Description

Returns the null terminated C string from a given user space memory address. Reports "<unknown>" on the rare cases when userspace data is not accessible.

Name

function::user_string2 — Retrieves string from user space with alternative error string

Synopsis

```
user_string2:string(addr:long,err_msg:string)
```

Arguments

addr	the user space address to retrieve the string from
err_msg	the error message to return when data isn't available

Description

Returns the null terminated C string from a given user space memory address. Reports the given error message on the rare cases when userspace data is not accessible.

Name

function::user_string_warn — Retrieves string from user space

Synopsis

```
user_string_warn:string(addr:long)
```

Arguments

addr the user space address to retrieve the string from

Description

Returns the null terminated C string from a given user space memory address. Reports "<unknown>" on the rare cases when userspace data is not accessible and warns (but does not abort) about the failure.

Name

function::user_string_quoted — Retrieves and quotes string from user space

Synopsis

```
user_string_quoted:string(addr:long)
```

Arguments

addr the user space address to retrieve the string from

Description

Returns the null terminated C string from a given user space memory address where any ASCII characters that are not printable are replaced by the corresponding escape sequence in the returned string. Reports “NULL” for address zero. Returns “<unknown>” on the rare cases when userspace data is not accessible at the given address.

Name

function::user_string_n — Retrieves string of given length from user space

Synopsis

```
user_string_n:string(addr:long,n:long)
```

Arguments

addr	the user space address to retrieve the string from
n	the maximum length of the string (if not null terminated)

Description

Returns the C string of a maximum given length from a given user space address. Returns "<unknown>" on the rare cases when userspace data is not accessible at the given address.

Name

function::user_string_n2 — Retrieves string of given length from user space

Synopsis

```
user_string_n2:string(addr:long,n:long,err_msg:string)
```

Arguments

addr	the user space address to retrieve the string from
n	the maximum length of the string (if not null terminated)
err_msg	the error message to return when data isn't available

Description

Returns the C string of a maximum given length from a given user space address. Returns the given error message string on the rare cases when userspace data is not accessible at the given address.

Name

function::user_string_n_warn — Retrieves string from user space

Synopsis

```
user_string_n_warn:string(addr:long,n:long)
```

Arguments

addr	the user space address to retrieve the string from
n	the maximum length of the string (if not null terminated)

Description

Returns up to n characters of a C string from a given user space memory address. Reports "<unknown>" on the rare cases when userspace data is not accessible and warns (but does not abort) about the failure.

Name

function::user_string_n_quoted — Retrieves and quotes string from user space

Synopsis

```
user_string_n_quoted:string(addr:long,n:long)
```

Arguments

addr	the user space address to retrieve the string from
n	the maximum length of the string (if not null terminated)

Description

Returns up to n characters of a C string from the given user space memory address where any ASCII characters that are not printable are replaced by the corresponding escape sequence in the returned string. Reports “NULL” for address zero. Returns “<unknown>” on the rare cases when userspace data is not accessible at the given address.

Name

function::user_char — Retrieves a char value stored in user space

Synopsis

```
user_char:long(addr:long)
```

Arguments

addr the user space address to retrieve the char from

Description

Returns the char value from a given user space address. Returns zero when user space data is not accessible.

Name

function::user_char_warn — Retrieves a char value stored in user space

Synopsis

```
user_char_warn:long(addr:long)
```

Arguments

addr the user space address to retrieve the char from

Description

Returns the char value from a given user space address. Returns zero when user space and warns (but does not abort) about the failure.

Name

function::user_short — Retrieves a short value stored in user space

Synopsis

```
user_short:long(addr:long)
```

Arguments

addr the user space address to retrieve the short from

Description

Returns the short value from a given user space address. Returns zero when user space data is not accessible.

Name

function::user_short_warn — Retrieves a short value stored in user space

Synopsis

```
user_short_warn:long(addr:long)
```

Arguments

addr the user space address to retrieve the short from

Description

Returns the short value from a given user space address. Returns zero when user space and warns (but does not abort) about the failure.

Name

function::user_ushort — Retrieves an unsigned short value stored in user space

Synopsis

```
user_ushort:long(addr:long)
```

Arguments

addr the user space address to retrieve the unsigned short from

Description

Returns the unsigned short value from a given user space address. Returns zero when user space data is not accessible.

Name

function::user_ushort_warn — Retrieves an unsigned short value stored in user space

Synopsis

```
user_ushort_warn:long(addr:long)
```

Arguments

addr the user space address to retrieve the unsigned short from

Description

Returns the unsigned short value from a given user space address. Returns zero when user space and warns (but does not abort) about the failure.

Name

function::user_int — Retrieves an int value stored in user space

Synopsis

```
user_int:long(addr:long)
```

Arguments

addr the user space address to retrieve the int from

Description

Returns the int value from a given user space address. Returns zero when user space data is not accessible.

Name

function::user_int_warn — Retrieves an int value stored in user space

Synopsis

```
user_int_warn:long(addr:long)
```

Arguments

addr the user space address to retrieve the int from

Description

Returns the int value from a given user space address. Returns zero when user space and warns (but does not abort) about the failure.

Name

function::user_long — Retrieves a long value stored in user space

Synopsis

```
user_long:long(addr:long)
```

Arguments

addr the user space address to retrieve the long from

Description

Returns the long value from a given user space address. Returns zero when user space data is not accessible. Note that the size of the long depends on the architecture of the current user space task (for those architectures that support both 64/32 bit compat tasks).

Name

function::user_long_warn — Retrieves a long value stored in user space

Synopsis

```
user_long_warn:long(addr:long)
```

Arguments

addr the user space address to retrieve the long from

Description

Returns the long value from a given user space address. Returns zero when user space and warns (but does not abort) about the failure. Note that the size of the long depends on the architecture of the current user space task (for those architectures that support both 64/32 bit compat tasks).

Name

function::user_int8 — Retrieves a 8-bit integer value stored in user space

Synopsis

```
user_int8:long(addr:long)
```

Arguments

addr the user space address to retrieve the 8-bit integer from

Description

Returns the 8-bit integer value from a given user space address. Returns zero when user space data is not accessible.

Name

function::user_uint8 — Retrieves an unsigned 8-bit integer value stored in user space

Synopsis

```
user_uint8:long(addr:long)
```

Arguments

addr the user space address to retrieve the unsigned 8-bit integer from

Description

Returns the unsigned 8-bit integer value from a given user space address. Returns zero when user space data is not accessible.

Name

function::user_int16 — Retrieves a 16-bit integer value stored in user space

Synopsis

```
user_int16:long(addr:long)
```

Arguments

addr the user space address to retrieve the 16-bit integer from

Description

Returns the 16-bit integer value from a given user space address. Returns zero when user space data is not accessible.

Name

function::user_uint16 — Retrieves an unsigned 16-bit integer value stored in user space

Synopsis

```
user_uint16:long(addr:long)
```

Arguments

addr the user space address to retrieve the unsigned 16-bit integer from

Description

Returns the unsigned 16-bit integer value from a given user space address. Returns zero when user space data is not accessible.

Name

function::user_int32 — Retrieves a 32-bit integer value stored in user space

Synopsis

```
user_int32:long(addr:long)
```

Arguments

addr the user space address to retrieve the 32-bit integer from

Description

Returns the 32-bit integer value from a given user space address. Returns zero when user space data is not accessible.

Name

function::user_uint32 — Retrieves an unsigned 32-bit integer value stored in user space

Synopsis

```
user_uint32:long(addr:long)
```

Arguments

addr the user space address to retrieve the unsigned 32-bit integer from

Description

Returns the unsigned 32-bit integer value from a given user space address. Returns zero when user space data is not accessible.

Name

function::user_int64 — Retrieves a 64-bit integer value stored in user space

Synopsis

```
user_int64:long(addr:long)
```

Arguments

addr the user space address to retrieve the 64-bit integer from

Description

Returns the 64-bit integer value from a given user space address. Returns zero when user space data is not accessible.

Name

function::user_uint64 — Retrieves an unsigned 64-bit integer value stored in user space

Synopsis

```
user_uint64:long(addr:long)
```

Arguments

addr the user space address to retrieve the unsigned 64-bit integer from

Description

Returns the unsigned 64-bit integer value from a given user space address. Returns zero when user space data is not accessible.

Chapter 23. String and data writing functions Tapset

The SystemTap guru mode can be used to test error handling in kernel code by simulating faults. The functions in the this tapset provide standard methods of writing to primitive types in the kernel's memory. All the functions in this tapset require the use of guru mode (**-g**).

Name

function::set_kernel_string — Writes a string to kernel memory

Synopsis

```
set_kernel_string(addr:long,val:string)
```

Arguments

addr	The kernel address to write the string to
val	The string which is to be written

Description

Writes the given string to a given kernel memory address. Reports an error on string copy fault. Requires the use of guru mode (-g).

Name

function::set_kernel_string_n — Writes a string of given length to kernel memory

Synopsis

```
set_kernel_string_n(addr:long,n:long,val:string)
```

Arguments

addr	The kernel address to write the string to
n	The maximum length of the string
val	The string which is to be written

Description

Writes the given string up to a maximum given length to a given kernel memory address. Reports an error on string copy fault. Requires the use of guru mode (-g).

Name

function::set_kernel_long — Writes a long value to kernel memory

Synopsis

```
set_kernel_long(addr:long,val:long)
```

Arguments

addr	The kernel address to write the long to
val	The long which is to be written

Description

Writes the long value to a given kernel memory address. Reports an error when writing to the given address fails. Requires the use of guru mode (-g).

Name

function::set_kernel_int — Writes an int value to kernel memory

Synopsis

```
set_kernel_int(addr:long,val:long)
```

Arguments

addr	The kernel address to write the int to
val	The int which is to be written

Description

Writes the int value to a given kernel memory address. Reports an error when writing to the given address fails. Requires the use of guru mode (-g).

Name

function::set_kernel_short — Writes a short value to kernel memory

Synopsis

```
set_kernel_short(addr:long,val:long)
```

Arguments

addr	The kernel address to write the short to
val	The short which is to be written

Description

Writes the short value to a given kernel memory address. Reports an error when writing to the given address fails. Requires the use of guru mode (-g).

Name

function::set_kernel_char — Writes a char value to kernel memory

Synopsis

```
set_kernel_char(addr:long,val:long)
```

Arguments

addr	The kernel address to write the char to
val	The char which is to be written

Description

Writes the char value to a given kernel memory address. Reports an error when writing to the given address fails. Requires the use of guru mode (-g).

Name

function::set_kernel_pointer — Writes a pointer value to kernel memory.

Synopsis

```
set_kernel_pointer(addr:long,val:long)
```

Arguments

addr	The kernel address to write the pointer to
val	The pointer which is to be written

Description

Writes the pointer value to a given kernel memory address. Reports an error when writing to the given address fails. Requires the use of guru mode (-g).

Chapter 24. A collection of standard string functions

Functions to get the length, a substring, getting at individual characters, string seaching, escaping, tokenizing, and converting strings to longs.

Name

function::strlen — Returns the length of a string

Synopsis

```
strlen:long(s:string)
```

Arguments

s the string

Description

This function returns the length of the string, which can be zero up to MAXSTRINGLEN.

Name

function::substr — Returns a substring

Synopsis

```
substr:string(str:string,start:long,length:long)
```

Arguments

str	the string to take a substring from
start	starting position of the extracted string (first character is 0)
length	length of string to return

Description

Returns the substring of the up to the given length starting at the given start position and ending at given stop position.

Name

function::stringat — Returns the char at a given position in the string

Synopsis

```
stringat:long(str:string,pos:long)
```

Arguments

str	the string to fetch the character from
pos	the position to get the character from (first character is 0)

Description

This function returns the character at a given position in the string or zero if thestring doesn't have as many characters.

Name

function::isinstr — Returns whether a string is a substring of another string

Synopsis

```
isinstr:long(s1:string,s2:string)
```

Arguments

s1 string to search in

s2 substring to find

Description

This function returns 1 if string *s1* contains *s2*, otherwise zero.

Name

function::text_str — Escape any non-printable chars in a string

Synopsis

```
text_str:string(input:string)
```

Arguments

input	the string to escape

Description

This function accepts a string argument, and any ASCII characters that are not printable are replaced by the corresponding escape sequence in the returned string.

Name

function::text_strn — Escape any non-printable chars in a string

Synopsis

```
text_strn:string(input:string,len:long,quoted:long)
```

Arguments

input the string to escape

len maximum length of string to return (0 implies MAXSTRINGLEN)

quoted put double quotes around the string. If input string is truncated it will have "..." after the second quote

Description

This function accepts a string of designated length, and any ASCII characters that are not printable are replaced by the corresponding escape sequence in the returned string.

Name

function::str_replace — str_replace Replaces all instances of a substring with another

Synopsis

```
str_replace:string(prnt_str:string,srch_str:string,rplc_str:string)
```

Arguments

prnt_str	the string to search and replace in
srch_str	the substring which is used to search in *prnt_str* string
rplc_str	the substring which is used to replace *srch_str*

Description

This function returns the given string with substrings replaced.

Name

function::strtol — strtol - Convert a string to a long

Synopsis

```
strtol:long(str:string,base:long)
```

Arguments

str	string to convert
base	the base to use

Description

This function converts the string representation of a number to an integer. The *base* parameter indicates the number base to assume for the string (eg. 16 for hex, 8 for octal, 2 for binary).

Name

function::isdigit — Checks for a digit

Synopsis

```
isdigit:long(str:string)
```

Arguments

str string to check

Description

Checks for a digit (0 through 9) as the first character of a string. Returns non-zero if true, and a zero if false.

Name

function::tokenize — Return the next non-empty token in a string

Synopsis

```
tokenize:string(input:string,delim:string)
```

Arguments

input string to tokenize. If NULL, returns the next non-empty token in the string passed in the previous call to `tokenize`.

delim set of characters that delimit the tokens

Description

This function returns the next non-empty token in the given input string, where the tokens are delimited by characters in the delim string. If the input string is non-NULL, it returns the first token. If the input string is NULL, it returns the next token in the string passed in the previous call to tokenize. If no delimiter is found, the entire remaining input string is returned. It returns NULL when no more tokens are available.

Chapter 25. Utility functions for using ansi control chars in logs

Utility functions for logging using ansi control characters. This lets you manipulate the cursor position and character color output and attributes of log messages.

Name

function::ansi_clear_screen — Move cursor to top left and clear screen.

Synopsis

```
ansi_clear_screen()
```

Arguments

None

Description

Sends ansi code for moving cursor to top left and then the ansi code for clearing the screen from the cursor position to the end.

Name

function::ansi_set_color — Set the ansi Select Graphic Rendition mode.

Synopsis

```
ansi_set_color(fg:long)
```

Arguments

fg Foreground color to set.

Description

Sends ansi code for Select Graphic Rendition mode for the given forground color. Black (30), Blue (34), Green (32), Cyan (36), Red (31), Purple (35), Brown (33), Light Gray (37).

Name

function::ansi_set_color2 — Set the ansi Select Graphic Rendition mode.

Synopsis

```
ansi_set_color2(fg:long,bg:long)
```

Arguments

fg Foreground color to set.

bg Background color to set.

Description

Sends ansi code for Select Graphic Rendition mode for the given forground color, Black (30), Blue (34), Green (32), Cyan (36), Red (31), Purple (35), Brown (33), Light Gray (37) and the given background color, Black (40), Red (41), Green (42), Yellow (43), Blue (44), Magenta (45), Cyan (46), White (47).

Name

function::ansi_set_color3 — Set the ansi Select Graphic Rendition mode.

Synopsis

```
ansi_set_color3(fg:long,bg:long,attr:long)
```

Arguments

fg	Foreground color to set.
bg	Background color to set.
attr	Color attribute to set.

Description

Sends ansi code for Select Graphic Rendition mode for the given forground color, Black (30), Blue (34), Green (32), Cyan (36), Red (31), Purple (35), Brown (33), Light Gray (37), the given background color, Black (40), Red (41), Green (42), Yellow (43), Blue (44), Magenta (45), Cyan (46), White (47) and the color attribute All attributes off (0), Intensity Bold (1), Underline Single (4), Blink Slow (5), Blink Rapid (6), Image Negative (7).

Name

function::ansi_reset_color — Resets Select Graphic Rendition mode.

Synopsis

```
ansi_reset_color()
```

Arguments

None

Description

Sends ansi code to reset foreground, background and color attribute to default values.

Name

function::ansi_new_line — Move cursor to new line.

Synopsis

```
ansi_new_line()
```

Arguments

None

Description

Sends ansi code new line.

Name

function::ansi_cursor_move — Move cursor to new coordinates.

Synopsis

```
ansi_cursor_move(x:long,y:long)
```

Arguments

- *x* Row to move the cursor to.
- *y* Colomn to move the cursor to.

Description

Sends ansi code for positioning the cursor at row x and column y. Coordinates start at one, (1,1) is the top-left corner.

Name

function::ansi_cursor_hide — Hides the cursor.

Synopsis

```
ansi_cursor_hide()
```

Arguments

None

Description

Sends ansi code for hiding the cursor.

Name

function::ansi_cursor_save — Saves the cursor position.

Synopsis

```
ansi_cursor_save()
```

Arguments

None

Description

Sends ansi code for saving the current cursor position.

Name

function::ansi_cursor_restore — Restores a previously saved cursor position.

Synopsis

```
ansi_cursor_restore()
```

Arguments

None

Description

Sends ansi code for restoring the current cursor position previously saved with `ansi_cursor_save`.

Name

function::ansi_cursor_show — Shows the cursor.

Synopsis

```
ansi_cursor_show()
```

Arguments

None

Description

Sends ansi code for showing the cursor.

Name

function::thread_indent — returns an amount of space with the current task information

Synopsis

```
thread_indent:string(delta:long)
```

Arguments

delta	the amount of space added/removed for each call

Description

This function returns a string with appropriate indentation for a thread. Call it with a small positive or matching negative delta. If this is the real outermost, initial level of indentation, then the function resets the relative timestamp base to zero. An example is shown at the end of this file.

Name

function::indent — returns an amount of space to indent

Synopsis

```
indent:string(delta:long)
```

Arguments

delta	the amount of space added/removed for each call

Description

This function returns a string with appropriate indentation. Call it with a small positive or matching negative delta. Unlike the thread_indent function, the indent does not track individual indent values on a per thread basis.

Chapter 26. SystemTap Translator Tapset

This family of user-space probe points is used to probe the operation of the SystemTap translator (**stap**) and run command (**staprun**). The tapset includes probes to watch the various phases of SystemTap and SystemTap's management of instrumentation cache. It contains the following probe points:

Name

probe::stap.pass0 — Starting stap pass0 (parsing command line arguments)

Synopsis

```
stap.pass0
```

Values

session the systemtap_session variable s

Description

pass0 fires after command line arguments have been parsed.

Name

probe::stap.pass0.end — Finished stap pass0 (parsing command line arguments)

Synopsis

```
stap.pass0.end
```

Values

session the systemtap_session variable s

Description

pass0.end fires just before the `gettimeofday` call for pass1.

Name

probe::stap.pass1a — Starting stap pass1 (parsing user script)

Synopsis

```
stap.pass1a
```

Values

session the systemtap_session variable s

Description

pass1a fires just after the call to `gettimeofday`, before the user script is parsed.

Name

probe::stap.pass1b — Starting stap pass1 (parsing library scripts)

Synopsis

```
stap.pass1b
```

Values

session the systemtap_session variable s

Description

pass1b fires just before the library scripts are parsed.

Name

probe::stap.pass1.end — Finished stap pass1 (parsing scripts)

Synopsis

```
stap.pass1.end
```

Values

session the systemtap_session variable s

Description

pass1.end fires just before the jump to cleanup if s.last_pass = 1.

Name

probe::stap.pass2 — Starting stap pass2 (elaboration)

Synopsis

```
stap.pass2
```

Values

session the systemtap_session variable s

Description

pass2 fires just after the call to `gettimeofday`, just before the call to semantic_pass.

Name

probe::stap.pass2.end — Finished stap pass2 (elaboration)

Synopsis

```
stap.pass2.end
```

Values

session the systemtap_session variable s

Description

pass2.end fires just before the jump to cleanup if s.last_pass = 2

Name

probe::stap.pass3 — Starting stap pass3 (translation to C)

Synopsis

```
stap.pass3
```

Values

session the systemtap_session variable s

Description

pass3 fires just after the call to `gettimeofday`, just before the call to translate_pass.

Name

probe::stap.pass3.end — Finished stap pass3 (translation to C)

Synopsis

```
stap.pass3.end
```

Values

session the systemtap_session variable s

Description

pass3.end fires just before the jump to cleanup if s.last_pass = 3

Name

probe::stap.pass4 — Starting stap pass4 (compile C code into kernel module)

Synopsis

```
stap.pass4
```

Values

session the systemtap_session variable s

Description

pass4 fires just after the call to `gettimeofday`, just before the call to compile_pass.

Name

probe::stap.pass4.end — Finished stap pass4 (compile C code into kernel module)

Synopsis

```
stap.pass4.end
```

Values

session the systemtap_session variable s

Description

pass4.end fires just before the jump to cleanup if s.last_pass = 4

Name

probe::stap.pass5 — Starting stap pass5 (running the instrumentation)

Synopsis

```
stap.pass5
```

Values

session the systemtap_session variable s

Description

pass5 fires just after the call to `gettimeofday`, just before the call to run_pass.

Name

probe::stap.pass5.end — Finished stap pass5 (running the instrumentation)

Synopsis

```
stap.pass5.end
```

Values

session the systemtap_session variable s

Description

pass5.end fires just before the cleanup label

Name

probe::stap.pass6 — Starting stap pass6 (cleanup)

Synopsis

```
stap.pass6
```

Values

session the systemtap_session variable s

Description

pass6 fires just after the cleanup label, essentially the same spot as pass5.end

Name

probe::stap.pass6.end — Finished stap pass6 (cleanup)

Synopsis

```
stap.pass6.end
```

Values

session the systemtap_session variable s

Description

pass6.end fires just before main's return.

Name

probe::stap.cache_clean — Removing file from stap cache

Synopsis

```
stap.cache_clean
```

Values

path the path to the .ko/.c file being removed

Description

Fires just before the call to unlink the module/source file.

Name

probe::stap.cache_add_mod — Adding kernel instrumentation module to cache

Synopsis

```
stap.cache_add_mod
```

Values

dest_path	the path the .ko file is going to (incl filename)
source_path	the path the .ko file is coming from (incl filename)

Description

Fires just before the file is actually moved. Note: if moving fails, cache_add_src and cache_add_nss will not fire.

Name

probe::stap.cache_add_src — Adding C code translation to cache

Synopsis

```
stap.cache_add_src
```

Values

dest_path	the path the .c file is going to (incl filename)
source_path	the path the .c file is coming from (incl filename)

Description

Fires just before the file is actually moved. Note: if moving the kernel module fails, this probe will not fire.

Name

probe::stap.cache_add_nss — Add NSS (Network Security Services) information to cache

Synopsis

```
stap.cache_add_nss
```

Values

dest_path	the path the .sgn file is coming from (incl filename)
source_path	the path the .sgn file is coming from (incl filename)

Description

Fires just before the file is actually moved. Note: stap must compiled with NSS support; if moving the kernel module fails, this probe will not fire.

Name

probe::stap.cache_get — Found item in stap cache

Synopsis

```
stap.cache_get
```

Values

source_path	the path of the .c source file
module_path	the path of the .ko kernel module file

Description

Fires just before the return of get_from_cache, when the cache grab is successful.

Name

probe::stap.system — Starting a command from stap

Synopsis

```
stap.system
```

Values

command the command string to be run by posix_spawn (as sh -c <str>)

Description

Fires at the entry of the stap_system command.

Name

probe::stap.system.spawn — stap spawned new process

Synopsis

```
stap.system.spawn
```

Values

ret the return value from posix_spawn

pid the pid of the spawned process

Description

Fires just after the call to posix_spawn.

Name

probe::stap.system.return — Finished a command from stap

Synopsis

```
stap.system.return
```

Values

ret a return code associated with running waitpid on the spawned process; a non-zero value indicates error

Description

Fires just before the return of the stap_system function, after waitpid.

Name

probe::staprun.insert_module — Inserting SystemTap instrumentation module

Synopsis

```
staprun.insert_module
```

Values

path the full path to the .ko kernel module about to be inserted

Description

Fires just before the call to insert the module.

Name

probe::staprun.remove_module — Removing SystemTap instrumentation module

Synopsis

```
staprun.remove_module
```

Values

name the stap module name to be removed (without the .ko extension)

Description

Fires just before the call to remove the module.

Name

probe::staprun.send_control_message — Sending a control message

Synopsis

```
staprun.send_control_message
```

Values

len	the length (in bytes) of the data blob
data	a ptr to a binary blob of data sent as the control message
type	type of message being send; defined in runtime/transport/transport_msgs.h

Description

Fires at the beginning of the send_request function.

Name

probe::stapio.receive_control_message — Recieved a control message

Synopsis

```
stapio.receive_control_message
```

Values

len	the length (in bytes) of the data blob
data	a ptr to a binary blob of data sent as the control message
type	type of message being send; defined in runtime/transport/transport_msgs.h

Description

Fires just after a message was receieved and before it's processed.
